## Problem 1: AND-XOR Canonical Form [12 points]

Let $F(a, b)$ be a Boolean function of two variables. We know that $F$ can be written as a canonical sum-ofproduct as follows:

$$
F(a, b)=\bar{a} \cdot \bar{b} \cdot F(0,0)+\bar{a} \cdot b \cdot F(0,1)+a \cdot \bar{b} \cdot F(1,0)+a \cdot b \cdot F(1,1)
$$

An alternative canonical form of writing $\boldsymbol{F}$ is using only AND and XOR functions. Show how to express F using only AND and XOR functions. HINT: each of the above product terms is a min-term, what property do the min-terms have in common and how is that useful for XOR functions?

## Solution:

Since the above expression has terms which are mutually exclusive (minterms, '+' can be replaced by $\oplus$

$$
\Rightarrow F(a, b)=\bar{a} \cdot \bar{b} \cdot F(0,0) \oplus \bar{a} b F(0,1) \oplus a b F(1,1)
$$

the inverted variables $(e . g . \bar{a})$ can be replaced with $a \oplus 1$

## Problem 2: Combinational Shifter [12 points]

Design a combinational logic circuit with 8 data inputs $\mathbf{A}_{\mathbf{1}}, \mathbf{A}_{\mathbf{2}}, \ldots, \mathbf{A}_{\mathbf{8}}$, three control inputs $\mathbf{S}_{\mathbf{2}}, \mathbf{S}_{\mathbf{1}}, \mathbf{S}_{\mathbf{0}}$, and 8 outputs $\mathbf{O}_{\mathbf{1}}, \mathbf{O}_{2}, \ldots, \mathbf{O}_{\mathbf{8}}$. The output word is equal to the input word, rotated to the right circularly by a number of bit positions specified by the control inputs. For example, if the input word is 10111010 and the control inputs are 011, then the output word is 01010111. Label your inputs and outputs clearly.

## Solution:

Problem 5: Latches versus Flip Flops [12 points]
Device A shown below is a level sensitive SR latch (i.e., it reacts to the $S$, $R$ inputs when the clock is high). Device B is an SR flip flop that is positive edge triggered. Device C is an SR flip flop that is negative edge triggered.

Assume 0 setup and hold times, and 0 propagation delays. All devices treat R and S as active high signals (i.e., reset when R is true, and Set when S is true), and are implemented using NOR gates. Initially the devices have 0 stored in them.

Complete the timing diagram below for the signals $\mathrm{Q}_{\mathrm{A}}, \mathrm{Q}_{\mathrm{B}}$, and $\mathrm{Q}_{\mathrm{C}}$, showing the behavior of the three different devices to the same S and R input changes.

## Problem 6: FSM Analysis and Design [20 points]

Problem 7: Serial 2's Complementer [10 points]
A serial two's complementer is to be designed. A binary integer of arbitrary length is presented to the serial two's complementer, least significant bit first, on input X. When a given bit is presented on input X , the corresponding output bit is to appear during the same clock cycle on output Z . To indicate that a sequence is complete and that the circuit is to be initialized to receive another sequence, input $Y$ becomes 1 for one clock cycle. Otherwise, Y is 0 . Draw the state diagram for the two's complementer circuit. Identify the meaning of each state in your diagram.
