Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## In-Text Concept Questions

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## 7.a

Electrical appliances (TV, stereo) use electric power as input. What happens to the power? Are those heat engines? What does the second law say about those devices?

Most electric appliances such as TV, VCR, stereo and clocks dissipate power in electrical circuits into internal energy (they get warm) some power goes into light and some power into mechanical energy. The light is absorbed by the room walls, furniture etc. and the mechanical energy is dissipated by friction so all the power eventually ends up as internal energy in the room mass of air and other substances.

These are not heat engines, just the opposite happens, namely electrical power is turned into internal energy and redistributed by heat transfer. These are irreversible processes.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## 7.b

Geothermal underground hot water or steam can be used to generate electric power. Does that violate the second law?

No.
Since the earth is not uniform we consider the hot water or steam supply as coming from one energy source (the high T) and we must reject heat to a low temperature reservoir as the ocean, a lake or the atmosphere which is another energy reservoir.

Iceland uses a significant amount of steam to heat buildings and to generate electricity.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
$7 . c$
A windmill produces power on a shaft taking kinetic energy out of the wind. Is it a heat engine? Is it a perpetual machine? Explain.

Since the wind is generated by a complex system driven by solar heat input and radiation out to space it is a kind of heat engine.

Within our lifetime it looks like it is perpetual. However with a different time scale the climate will change, the sun will grow to engulf the earth as it burns out of fuel. There is a storage effect and a non-uniform distribution of states in the system that drives this.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.d
heat engines and heat pumps (refrigerators) are energy conversion devices altering amounts of energy transfer between Q and W . Which conversion direction $(\mathrm{Q} \rightarrow \mathrm{W}$ or $\mathrm{W} \rightarrow \mathrm{Q})$ is limited and which is unlimited according to the second law.

The work output of a heat engine is limited ( Q to W ).
You can transform W to Q unlimited (a heat pump that does not work well or you may think about heat generated by friction).
7.e

Ice cubes in a glass of liquid water will eventually melt and all the water approach room temperature. Is this a reversible process? Why?

There is heat transfer from the warmer ambient to the water as long as there is a temperature difference. Eventually the temperatures approach each other and there is no more heat transfer. This is irreversible, as we cannot make ice-cubes out of the water unless we run a refrigerator and that requires a work from the surroundings, which does not leave the
 surroundings unchanged.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Does a process become more or less reversible with respect to heat transfer if it is fast rather than slow? Hint: Recall from Chapter 4 that $\dot{Q}=C A \Delta T$.

If the higher heat transfer rate is caused by a larger $\Delta T$ then the process is more irreversible so as the process would be slower due to a lower $\Delta \mathrm{T}$ then it approaches a reversible process. If the rate of heat transfer is altered due to the factor CA with the same $\Delta \mathrm{T}$ then it is irreversible to the same degree.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.9

If you generated hydrogen from, say, solar power, which of these would be more efficient: (1) transport it and then burn it in an engine or (2) convert the solar power to electricity and transport that? What else would you need to know in order to give a definite answer?

Case (1):
First there is a certain efficiency when converting solar power to hydrogen. Then the transport and packaging of hydrogen has some energy expenditures associated with it. The hydrogen could be compressed to a high pressure (typically 70 MPa ) which is expensive in terms of work input and then stored in a tank. One alternative would be to cool it down to become a liquid to have a much smaller volume but the temperature at which this happens is very low so the cooling and continued cooling under transport requires a significant work input also. Certain materials like metal-hydrides, boron salt slurries and nano-carbon fibers allows storage of hydrogen at more modest pressures and are all currently under investigation as other alternative storage methods. After the hydrogen is transported to an engine then the engine efficiency determines the work output.

Case (2):
If the solar power is located where there is access to electrical transmission lines then it can be used in solar panels, solar heating of water or other substance to run a heat engine cycle like a power plant to generate electricity. To make new transmission lines is costly and has an impact on the environment that must be considered.

You also need to look at the time of day/year at which the power is required and when it is available. The end use also presents some limitations like if the power should be used for a car then the energy must be stored temporarily like in a battery.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## Concept Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## 7.1

Two heat engines operate between the same two energy reservoirs and both receives the same $\mathrm{Q}_{\mathrm{H}}$. One engine is reversible and the other is not. What can you say about the two $\mathrm{Q}_{\mathrm{L}}$ 's?

The reversible heat engine can produce more work (has a higher efficiency) than the irreversible heat engine and due to the energy conservation it then gives out a smaller $\mathrm{Q}_{\mathrm{L}}$ compared to the irreversible heat engine.

$$
\begin{aligned}
\mathrm{W}_{\text {rev }} & =\mathrm{Q}_{\mathrm{H}}-\mathrm{Q}_{\mathrm{L} \text { rev }} \quad>\quad \mathrm{W}_{\text {irrev }}=\mathrm{Q}_{\mathrm{H}}-\mathrm{Q}_{\mathrm{L} \text { irrev }} \\
& \Rightarrow \quad \mathrm{Q}_{\mathrm{L} \text { rev }}<\mathrm{Q}_{\mathrm{L} \text { irrev }}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## 7.2

Compare two domestic heat pumps ( A and B ) running with the same work input. If $A$ is better than $B$ which one heats the house most?

The statement that A is better means it has a higher COP and since

$$
\mathrm{Q}_{\mathrm{HA}}=\mathrm{COP}_{\mathrm{A}} \mathrm{~W}>\mathrm{Q}_{\mathrm{HB}}=\mathrm{COP}_{\mathrm{B}} \mathrm{~W}
$$

it can thus provide more heat to the house. The higher heat comes from the higher $\mathrm{Q}_{\mathrm{L}}$ it is able to draw in.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## 7.3

Suppose we forget the model for heat transfer as $\dot{Q}=C A \Delta T$, can we draw some information about direction of Q from the second law?

One of the classical statements of the second law is the Clausius statement saying that you cannot have heat transfer from a lower temperature domain to a higher temperature domain without work input.

The opposite, namely a transfer of heat from a high temperature domain towards a lower temperature domain can happen (which is a heat engine with zero efficiency).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## 7.4

A combination of two heat engines is shown in Fig. P7.4. Find the overall thermal efficiency as a function of the two individual efficiencies.

The overall efficiency

$$
\eta_{\mathrm{TH}}=\dot{\mathrm{W}}_{\mathrm{net}} / \dot{\mathrm{Q}}_{\mathrm{H}}=\left(\dot{\mathrm{W}}_{1}+\dot{\mathrm{W}}_{2}\right) / \dot{\mathrm{Q}}_{\mathrm{H}}=\eta_{1}+\dot{\mathrm{W}}_{2} / \dot{\mathrm{Q}}_{\mathrm{H}}
$$

For the second heat engine and the energy Eq. for the first heat engine

$$
\dot{\mathrm{W}}_{2}=\eta_{2} \dot{\mathrm{Q}}_{\mathrm{M}}=\eta_{2}\left(1-\eta_{1}\right) \dot{\mathrm{Q}}_{\mathrm{H}}
$$

so the final result is

$$
\eta_{\mathrm{TH}}=\eta_{1}+\eta_{2}\left(1-\eta_{1}\right)
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## 7.5

Compare two heat engines receiving the same Q , one at 1200 K and the other at 1800 K ; they both reject heat at 500 K . Which one is better?

The maximum efficiency for the engines are given by the Carnot heat engine efficiency as

$$
\eta_{\mathrm{TH}}=\dot{\mathrm{W}}_{\mathrm{net}} / \dot{\mathrm{Q}}_{\mathrm{H}}=1-\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}
$$

Since they have the same low temperature the one with the highest $\mathrm{T}_{\mathrm{H}}$ will have a higher efficiency and thus presumably better.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A car engine takes atmospheric air in at $20^{\circ} \mathrm{C}$, no fuel, and exhausts the air at $20^{\circ} \mathrm{C}$ producing work in the process. What do the first and the second laws say about that?

Energy Eq.: $\quad W=Q_{H}-Q_{L}=$ change in energy of air. $\quad$ OK $2^{\text {nd }}$ law: Exchange energy with only one reservoir. NOT OK. This is a violation of the statement of Kelvin-Planck.

Remark: You cannot create and maintain your own energy reservoir.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.7

A combination of two refrigerator cycles is shown in Fig. P7.7. Find the overall COP as a function of $\mathrm{COP}_{1}$ and $\mathrm{COP}_{2}$.

The overall COP becomes

$$
\mathrm{COP}=\beta=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\dot{\mathrm{~W}}_{\mathrm{tot}}}=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\dot{\mathrm{~W}}_{1}} \frac{\dot{\mathrm{~W}}_{1}}{\dot{\mathrm{~W}}_{\mathrm{tot}}}=\mathrm{COP}_{1} \frac{\dot{\mathrm{~W}}_{1}}{\dot{\mathrm{~W}}_{\mathrm{tot}}}=\mathrm{COP}_{1} \frac{1}{1+\dot{\mathrm{W}}_{2} / \dot{\mathrm{W}}_{1}}
$$

where we used $\dot{\mathrm{W}}_{\text {tot }}=\dot{\mathrm{W}}_{1}+\dot{\mathrm{W}}_{2}$. Use definition of $\mathrm{COP}_{2}$ and energy equation for refrigerator 1 to eliminate $\dot{\mathrm{Q}}_{\mathrm{M}}$ and we have

$$
\dot{\mathrm{W}}_{2}=\dot{\mathrm{Q}}_{\mathrm{M}} / \mathrm{COP}_{2}=\left(\dot{\mathrm{W}}_{1}+\dot{\mathrm{Q}}_{\mathrm{L}}\right) / \mathrm{COP}_{2}
$$

so then

$$
\dot{\mathrm{W}}_{2} / \dot{\mathrm{W}}_{1}=\left(1+\dot{\mathrm{Q}}_{\mathrm{L}} / \dot{\mathrm{W}}_{1}\right) / \mathrm{COP}_{2}=\left(1+\mathrm{COP}_{1}\right) / \mathrm{COP}_{2}
$$

Finally substitute into the first equation and rearrange a little to get

$$
\mathrm{COP}=\beta=\frac{\mathrm{COP}_{1} \mathrm{COP}_{2}}{\mathrm{COP}_{1}+\mathrm{COP}_{2}+1}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## 7.8

After you have returned from a car trip the car engine has cooled down and is thus back to the state in which it started. What happened to all the energy released in the burning of the gasoline? What happened to all the work the engine gave out?

Solution:
All the energy from the fuel generates heat and work out of the engine. The heat is directly dissipated in the atmosphere and the work is turned into kinetic energy and internal energy by all the frictional forces (wind resistance, rolling resistance, brake action). Eventually the kinetic energy is lost by braking the car so in the end all the energy is absorbed by the environment increasing its internal energy.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## 7.9

Does a reversible heat engine burning coal (which, in practice, cannot be done reversibly) have impacts on our world other than depletion of the coal reserve?

## Solution:

When you burn coal you form carbon dioxide $\mathrm{CO}_{2}$ which is a greenhouse gas. It absorbs energy over a wide spectrum of wavelengths and thus traps energy in the atmosphere that otherwise would go out into space.

Coal from various locations also has sulfur and other substances like heavy metals in it. The sulfur generates sulfuric acid (resulting in acid rain) in the atmosphere and can damage the forests.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

If the efficiency of a power plant goes up as the low temperature drops, why do power plants not just reject energy at say $-40^{\circ} \mathrm{C}$ ?

In order to reject heat the ambient must be at the low temperature. Only if we moved the plant to the North Pole would we see such a low T.

Remark: You cannot create and maintain your own energy reservoir.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.11

If the efficiency of a power plant goes up as the low temperature drops why not let the heat rejection go to a refrigerator at, say, $-10^{\circ} \mathrm{C}$ instead of ambient $20^{\circ} \mathrm{C}$ ?

The refrigerator must pump the heat up to $20^{\circ} \mathrm{C}$ to reject it to the ambient. The refrigerator must then have a work input that will exactly offset the increased work output of the power plant, if they are both ideal. As we can not build ideal devices the actual refrigerator will require more work than the power plant will produce extra.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.12

A coal-fired power plant operates with a high T of $600^{\circ} \mathrm{C}$ whereas a jet engine has about 1400 K . Does that mean we should replace all power plants with jet engines?

The thermal efficiency is limited by the Carnot heat engine efficiency.
That is, the low temperature is also important. Here the power plant has a much lower T in the condenser than the jet engine has in the exhaust flow so the jet engine does not necessarily have a higher efficiency than the power plant.

Gas-turbines are used in power plants where they can cover peak power demands needed for shorter time periods and their high temperature exhaust can be used to boil additional water for the steam cycle.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.13

A heat transfer requires a temperature difference, see chapter 4 , to push the $\dot{\mathrm{Q}}$. What implications do that have for a real heat engine? A refrigerator?

This means that there are temperature differences between the source of energy and the working substance so $\mathrm{T}_{\mathrm{H}}$ is smaller than the source temperature. This lowers the maximum possible efficiency. As heat is rejected the working substance must have a higher temperature $\mathrm{T}_{\mathrm{L}}$ than the ambient receiving the $\dot{\mathrm{Q}}_{\mathrm{L}}$, which lowers the efficiency further.

For a refrigerator the high temperature must be higher than the ambient to which the $\dot{\mathrm{Q}}_{\mathrm{H}}$ is moved. Likewise the low temperature must be lower than the cold space temperature in order to have heat transfer from the cold space to the cycle substance. So the net effect is the cycle temperature difference is larger than the reservoir temperature difference and thus the COP is lower than that estimated from the cold space and ambient temperatures.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.14

Hot combustion gases (air) at 1500 K are used as heat source in a heat engine where the gas is cooled to 750 K and the ambient is at 300 K . This is not a constant T source. How does that affect the efficiency?

Solution:

If the efficiency is written as
$\eta_{\mathrm{TH}}=\dot{\mathrm{W}}_{\text {net }} / \dot{\mathrm{Q}}_{\mathrm{H}}=1-\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{T}_{\mathrm{H}}}$
then $\mathrm{T}_{\mathrm{H}}$ is somewhere between 1500 K and 750 K and it is not a linear average.

After studying chapter 8 and 9 we can solve this problem and find the proper average high temperature based on properties at states 1 and 2 .

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## Heat Engines and Refrigerators

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.15

A gasoline engine produces 20 hp using 35 kW of heat transfer from burning fuel. What is its thermal efficiency and how much power is rejected to the ambient?

Conversion Table A.1: $\quad 20 \mathrm{hp}=20 \times 0.7457 \mathrm{~kW}=14.91 \mathrm{~kW}$
Efficiency: $\quad \eta_{\mathrm{TH}}=\dot{\mathrm{W}}_{\text {out }} / \dot{\mathrm{Q}}_{\mathrm{H}}=\frac{14.91}{35}=\mathbf{0 . 4 3}$

Energy equation: $\quad \dot{\mathrm{Q}}_{\mathrm{L}}=\dot{\mathrm{Q}}_{\mathrm{H}}-\dot{\mathrm{W}}_{\text {out }}=35-14.91=\mathbf{2 0 . 1} \mathbf{~ k W}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.16

Calculate the thermal efficiency of the steam power plant cycle described in Example 6.9.

Solution:
From solution to Example 6.9,

$$
\begin{aligned}
\mathrm{w}_{\mathrm{net}} & =\mathrm{w}_{\mathrm{t}}+\mathrm{w}_{\mathrm{p}}=640.7-4 \\
& =636.7 \mathrm{~kJ} / \mathrm{kg} \\
\mathrm{q}_{\mathrm{H}} & =\mathrm{q}_{\mathrm{b}}=2831 \mathrm{~kJ} / \mathrm{kg} \\
\eta_{\mathrm{TH}} & =\mathrm{w}_{\text {net }} / \mathrm{q}_{\mathrm{H}}=\frac{636.7}{2831}=\mathbf{0 . 2 2 5}
\end{aligned}
$$

Notice we cannot write $\mathrm{w}_{\text {net }}=\mathrm{q}_{\mathrm{H}}-\mathrm{q}_{\mathrm{L}}$ as there is an extra heat transfer ${ }_{1} \dot{\mathrm{Q}}_{2}$ as a loss in the line. This needs to be accounted for in the overall energy equation.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.17

A refrigerator removes 1.5 kJ from the cold space using 1 kJ work input. How much energy goes into the kitchen and what is its coefficient of performance?
C.V. Refrigerator. The energy $\mathrm{Q}_{\mathrm{H}}$ goes into the kitchen air.

Energy Eq.:
$\mathrm{Q}_{\mathrm{H}}=\mathrm{W}+\mathrm{Q}_{\mathrm{L}}=1+1.5=\mathbf{2 . 5} \mathbf{k J}$
COP:

$$
\beta=\frac{\mathrm{Q}_{\mathrm{L}}}{\mathrm{~W}}=1.5 / 1=\mathbf{1 . 5}
$$

The back side of the refrigerator has a black grille that heats the kitchen air. Other models have that at the bottom with a fan to drive the air over it.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.18

Calculate the coefficient of performance of the R-134a refrigerator given in Example 6.10.
Solution:
From the definition

$$
\beta=\mathrm{Q}_{\mathrm{L}} / \mathrm{W}_{\mathrm{IN}}=\frac{14.54}{5}=2.91
$$

Notice we cannot write $\mathrm{W}_{\mathrm{IN}}=\mathrm{Q}_{\mathrm{H}}-\mathrm{Q}_{\mathrm{L}}$ as there is a small Q in the compressor. This needs to be accounted for in the overall energy equation.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.19

A coal fired power plant has an efficiency of $35 \%$ and produces net 500 MW of electricity. Coal releases $25000 \mathrm{~kJ} / \mathrm{kg}$ as it burns so how much coal is used per hour?

From the definition of the thermal efficiency and the energy release by the combustion called heating value HV we get

$$
\dot{\mathrm{W}}=\eta \dot{\mathrm{Q}}_{\mathrm{H}}=\eta \cdot \dot{\mathrm{m}} \cdot \mathrm{HV}
$$

then

$$
\begin{aligned}
\dot{\mathrm{m}} & =\frac{\dot{\mathrm{W}}}{\eta \times \mathrm{HV}}=\frac{500 \mathrm{MW}}{0.35 \times 25000 \mathrm{~kJ} / \mathrm{kg}}=\frac{500 \times 1000 \mathrm{~kJ} / \mathrm{s}}{0.35 \times 25000 \mathrm{~kJ} / \mathrm{kg}} \\
& =57.14 \mathrm{~kg} / \mathrm{s}=\mathbf{2 0 5 7 1 4 ~ \mathbf { ~ k g } / \mathbf { h }}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Assume we have a refrigerator operating at steady state using 500 W of electric power with a COP of 2.5 . What is the net effect on the kitchen air?

Take a C.V. around the whole kitchen. The only energy term that crosses the control surface is the work input $\dot{\mathrm{W}}$ apart from energy exchanged with the kitchen surroundings. That is the kitchen is being heated with a rate of $\dot{W}$.

Remark: The two heat transfer rates are both internal to the kitchen. $\dot{\mathrm{Q}}_{\mathrm{H}}$ goes into the kitchen air and $\dot{\mathrm{Q}}_{\mathrm{L}}$ actually leaks from the kitchen into the refrigerated space, which is the reason we need to drive it out again.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A room is heated with a 1500 W electric heater. How much power can be saved if a heat pump with a COP of 2.0 is used instead?

Assume the heat pump has to deliver 1500 W as the $\dot{\mathrm{Q}}_{\mathrm{H}}$.
Heat pump: $\quad \beta^{\prime}=\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{W}}_{\mathrm{IN}}$

$$
\dot{\mathrm{W}}_{\mathrm{IN}}=\dot{\mathrm{Q}}_{\mathrm{H}} / \beta^{\prime}=\frac{1500}{2}=750 \mathrm{~W}
$$

So the heat pump requires an input of 750 W thus saving the difference

$$
\dot{\mathrm{W}}_{\text {saved }}=1500 \mathrm{~W}-750 \mathrm{~W}=\mathbf{7 5 0} \mathbf{W}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

An air-conditioner discards 5.1 kW to the ambient with a power input of 1.5 kW . Find the rate of cooling and the coefficient of performance.

Solution:
In this case $\dot{\mathrm{Q}}_{\mathrm{H}}=5.1 \mathrm{~kW}$ goes to the ambient so
Energy Eq. : $\dot{\mathrm{Q}}_{\mathrm{L}}=\dot{\mathrm{Q}}_{\mathrm{H}}-\dot{\mathrm{W}}=5.1-1.5=\mathbf{3 . 6} \mathbf{~ k W}$

$$
\beta_{\text {REFRIG }}=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\dot{\mathrm{~W}}}=\frac{3.6}{1.5}=\mathbf{2 . 4}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Calculate the thermal efficiency of the steam power plant cycle described in Problem 6.103.

From solution to Problem 6.103,

$$
\begin{aligned}
& \text { Turbine } \quad \begin{array}{l}
\mathrm{A}_{5}=(\pi / 4)(0.2)^{2}=0.03142 \mathrm{~m}^{2} \\
\mathrm{~V}_{5}=\dot{\mathrm{m}} \mathrm{v}_{5} / \mathrm{A}_{5}=25 \times 0.06163 / 0.03142=49 \mathrm{~m} / \mathrm{s} \\
\mathrm{~h}_{6}=191.83+0.92 \times 2392.8=2393.2 \mathrm{~kJ} / \mathrm{kg} \\
\mathrm{w}_{\mathrm{T}}=3404-2393.2-\left(200^{2}-49^{2}\right) /(2 \times 1000)=992 \mathrm{~kJ} / \mathrm{kg} \\
\dot{\mathrm{~W}}_{\mathrm{T}}=\dot{\mathrm{m}}_{\mathrm{T}}=25 \times 992=24800 \mathrm{~kW} \\
\dot{\mathrm{~W}}_{\mathrm{NET}}=24800-300=24500 \mathrm{~kW}
\end{array}
\end{aligned}
$$

From the solution to Problem 6.105
Economizer $\quad \mathrm{A}_{7}=\pi \mathrm{D}_{7}^{2} / 4=0.004418 \mathrm{~m}^{2}, \quad \mathrm{v}_{7}=0.001008 \mathrm{~m}^{3} / \mathrm{kg}$

$$
\begin{aligned}
& \mathbf{V}_{2}=\mathbf{V}_{7}=\dot{\mathrm{m}} / \mathrm{A}_{7}=25 \times 0.001008 / 0.004418=5.7 \mathrm{~m} / \mathrm{s} \\
& \mathbf{V}_{3}=\left(\mathrm{v}_{3} / \mathrm{v}_{2}\right) \mathbf{V}_{2}=(0.001118 / 0.001008) 5.7=6.3 \mathrm{~m} / \mathrm{s} \approx \mathbf{V}_{2}
\end{aligned}
$$

so kinetic energy change is unimportant

$$
\begin{aligned}
& \mathrm{q}_{\mathrm{ECON}}=\mathrm{h}_{3}-\mathrm{h}_{2}=744-194=550.0 \mathrm{~kJ} / \mathrm{kg} \\
& \dot{\mathrm{Q}}_{\mathrm{ECON}}=\dot{\mathrm{m}} \mathrm{q}_{\mathrm{ECON}}=25(550.0)=13750 \mathrm{~kW}
\end{aligned}
$$

Generator $\quad \mathrm{A}_{4}=\pi \mathrm{D}_{4}^{2} / 4=0.03142 \mathrm{~m}^{2}, \quad \mathrm{v}_{4}=0.06023 \mathrm{~m}^{3} / \mathrm{kg}$

$$
\begin{aligned}
& \mathbf{V}_{4}=\dot{\mathrm{m}} \mathrm{v}_{4} / \mathrm{A}_{4}=25 \times 0.06023 / 0.03142=47.9 \mathrm{~m} / \mathrm{s} \\
& \mathrm{q}_{\mathrm{GEN}}=3426-744+\left(47.9^{2}-6.3^{2}\right) /(2 \times 1000)=2683 \mathrm{~kJ} / \mathrm{kg} \\
& \dot{\mathrm{Q}}_{\mathrm{GEN}}=25 \times(2683)=67075 \mathrm{~kW}
\end{aligned}
$$

The total added heat transfer is

$$
\begin{aligned}
\dot{\mathrm{Q}}_{\mathrm{H}}= & 13758+67075=80833 \mathrm{~kW} \\
& \Rightarrow \eta_{\mathrm{TH}}=\dot{\mathrm{W}}_{\mathrm{NET}} / \dot{\mathrm{Q}}_{\mathrm{H}}=\frac{24500}{80833}=\mathbf{0 . 3 0 3}
\end{aligned}
$$

Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.24

A window air-conditioner unit is placed on a laboratory bench and tested in cooling mode using 750 W of electric power with a COP of 1.75 . What is the cooling power capacity and what is the net effect on the laboratory?

Definition of COP: $\quad \beta=\dot{\mathrm{Q}}_{\mathrm{L}} / \dot{\mathrm{W}}$
Cooling capacity: $\quad \dot{\mathrm{Q}}_{\mathrm{L}}=\beta \dot{\mathrm{W}}=1.75 \times 750=\mathbf{1 3 1 3} \mathbf{W}$

For steady state operation the $\dot{\mathrm{Q}}_{\mathrm{L}}$ comes from the laboratory and $\dot{\mathrm{Q}}_{\mathrm{H}}$ goes to the laboratory giving a net to the lab of $\dot{\mathrm{W}}=\dot{\mathrm{Q}}_{\mathrm{H}}-\dot{\mathrm{Q}}_{\mathrm{L}}=750 \mathrm{~W}$, that is heating it.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.25

A water cooler for drinking water should cool $25 \mathrm{~L} / \mathrm{h}$ water from $18^{\circ} \mathrm{C}$ to $10^{\circ} \mathrm{C}$ using a small refrigeration unit with a COP of 2.5 . Find the rate of cooling required and the power input to the unit.

The mass flow rate is

$$
\dot{\mathrm{m}}=\rho \dot{\mathrm{V}}=\frac{25 \times 10^{-3}}{0.001002} \frac{1}{3600} \mathrm{~kg} / \mathrm{s}=6.93 \mathrm{~g} / \mathrm{s}
$$

Energy equation for heat exchanger

$$
\begin{aligned}
\dot{\mathrm{Q}}_{\mathrm{L}} & =\dot{\mathrm{m}}\left(\mathrm{~h}_{1}-\mathrm{h}_{2}\right)=\dot{\mathrm{m}} \mathrm{C}_{\mathrm{P}}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right) \\
& =6.93 \times 10^{-3} \times 4.18 \times(18-10)=0.2318 \mathrm{~kW} \\
\beta & =\mathrm{COP}=\dot{\mathrm{Q}}_{\mathrm{L}} / \dot{\mathrm{W}} \quad \Rightarrow \quad \dot{\mathrm{~W}}=\dot{\mathrm{Q}}_{\mathrm{L}} / \beta=0.2318 / 2.5=\mathbf{0 . 0 9 3} \mathbf{~ k W}
\end{aligned}
$$

Comment: The unit does not operate continuously.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A farmer runs a heat pump with a 2 kW motor. It should keep a chicken hatchery at $30^{\circ} \mathrm{C}$, which loses energy at a rate of 10 kW to the colder ambient $\mathrm{T}_{\mathrm{amb}}$. What is the minimum coefficient of performance that will be acceptable for the heat pump?
Solution:
Power input: $\dot{\mathrm{W}}=2 \mathrm{~kW}$
Energy Eq. for hatchery: $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{Q}}_{\mathrm{Loss}}=10 \mathrm{~kW}$

Definition of COP:

$$
\beta=\mathrm{COP}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\dot{\mathrm{~W}}}=\frac{10}{2}=\mathbf{5}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Calculate the coefficient of performance of the R-410a heat pump cycle described in Problem 6.108.

Solution:

From solution to Problem 6.108, CV: Condenser

$$
\begin{aligned}
\dot{\mathrm{Q}}_{\mathrm{COND}} & =\dot{\mathrm{m}}\left(\mathrm{~h}_{3}-\mathrm{h}_{2}\right) \\
& =0.05 \mathrm{~kg} / \mathrm{s}(134-367) \mathrm{kJ} / \mathrm{kg} \\
& =-11.65 \mathrm{~kW}
\end{aligned}
$$

Then with the work as $-\dot{\mathrm{W}}_{\mathrm{IN}}=5.0 \mathrm{~kW}$ we
 have $\dot{\mathrm{Q}}_{\mathrm{H}}=-\dot{\mathrm{Q}}_{\mathrm{COND}}$

Heat pump: $\quad \beta^{\prime}=\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{W}}_{\mathrm{IN}}=\frac{11.65}{5.0}=\mathbf{2 . 3 3}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.28

A power plant generates 150 MW of electrical power. It uses a supply of 1000 MW from a geothermal source and rejects energy to the atmosphere. Find the power to the air and how much air should be flowed to the cooling tower ( $\mathrm{kg} / \mathrm{s}$ ) if its temperature cannot be increased more than $10^{\circ} \mathrm{C}$.

Solution:
C.V. Total power plant.

Energy equation gives the amount of heat rejection to the atmosphere as

$$
\dot{\mathrm{Q}}_{\mathrm{L}}=\dot{\mathrm{Q}}_{\mathrm{H}}-\dot{\mathrm{W}}=1000-150=\mathbf{8 5 0} \mathbf{~ M W}
$$

The energy equation for the air flow that absorbs the energy is

$$
\begin{aligned}
& \dot{\mathrm{Q}}_{\mathrm{L}}=\dot{\mathrm{m}}_{\mathrm{air}} \Delta \mathrm{~h}=\dot{\mathrm{m}}_{\text {air }} \mathrm{C}_{\mathrm{p}} \Delta \mathrm{~T} \\
& \dot{\mathrm{~m}}_{\text {air }}=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\mathrm{C}_{\mathrm{p}} \Delta \mathrm{~T}}=\frac{850 \times 1000}{1.004 \times 10}=\mathbf{8 4 6 6 1} \mathbf{~ k g} / \mathbf{s}
\end{aligned}
$$

Probably too large to make, so some cooling by liquid water or evaporative cooling should be used.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A water cooler for drinking water should cool $25 \mathrm{~L} / \mathrm{h}$ water from $18^{\circ} \mathrm{C}$ to $10^{\circ} \mathrm{C}$ while the water reservoir also gains 60 W from heat transfer. Assume a small refrigeration unit with a COP of 2.5 does the cooling. Find the total rate of cooling required and the power input to the unit.

The mass flow rate is

$$
\dot{\mathrm{m}}=\boldsymbol{\rho} \dot{\mathrm{V}}=\frac{25 \times 10^{-3}}{0.001002} \frac{1}{3600} \mathrm{~kg} / \mathrm{s}=6.93 \mathrm{~g} / \mathrm{s}
$$

Energy equation for heat exchanger

$$
\begin{aligned}
\dot{\mathrm{Q}}_{\mathrm{L}} & =\dot{\mathrm{m}}\left(\mathrm{~h}_{1}-\mathrm{h}_{2}\right)+\dot{\mathrm{Q}}_{\mathrm{H} T R} \\
& =\dot{\mathrm{m}} \mathrm{C}_{\mathrm{P}}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)+\dot{\mathrm{Q}}_{\mathrm{H} \text { TR }} \\
& =6.93 \times 10^{-3} \times 4.18 \times(18-10) \mathrm{kW}+60 \mathrm{~W} \\
& =291.8 \mathrm{~W} \\
\beta & =\mathrm{COP}=\dot{\mathrm{Q}}_{\mathrm{L}} / \dot{\mathrm{W}} \Rightarrow \quad \dot{\mathrm{~W}}=\dot{\mathrm{Q}}_{\mathrm{L}} / \beta=291.8 / 2.5=\mathbf{1 1 6 . 7} \mathbf{~ W}
\end{aligned}
$$

Comment: The unit does not operate continuously.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A car engine delivers 25 hp to the driveshaft with a thermal efficiency of $30 \%$. The fuel has a heating value of $40000 \mathrm{~kJ} / \mathrm{kg}$. Find the rate of fuel consumption and the combined power rejected through the radiator and exhaust.
Solution:
Heating value $(\mathrm{HV}): \quad \dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{m}} \cdot \mathrm{HV}$
From the definition of the thermal efficiency

$$
\begin{gathered}
\dot{\mathrm{W}}=\eta \dot{\mathrm{Q}}_{\mathrm{H}}=\eta \cdot \dot{\mathrm{m}} \cdot \mathrm{HV} \\
\dot{\mathrm{~m}}=\frac{\dot{\mathrm{W}}}{\eta \cdot \mathrm{HV}}=\frac{25 \times 0.7355}{0.3 \times 40000}=0.00153 \mathrm{~kg} / \mathrm{s}=\mathbf{1 . 5 3} \mathbf{~ g} / \mathbf{s}
\end{gathered}
$$

Conversion of power from hp to kW in Table A.1.

$$
\begin{aligned}
\dot{\mathrm{Q}}_{\mathrm{L}} & =\dot{\mathrm{Q}}_{\mathrm{H}}-\dot{\mathrm{W}}=(\dot{\mathrm{W}} / \eta-\dot{\mathrm{W}})=\left(\frac{1}{\eta}-1\right) \dot{\mathrm{W}} \\
& =\left(\frac{1}{0.3}-1\right) 25 \times 0.7355=\mathbf{4 2 . 9} \mathbf{~ k W}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.31

R-410a enters the evaporator (the cold heat exchanger) in an $\mathrm{A} / \mathrm{C}$ unit at $-20^{\circ} \mathrm{C}$, x $=28 \%$ and leaves at $-20^{\circ} \mathrm{C}, \mathrm{x}=1$. The COP of the refrigerator is 1.5 and the mass flow rate is $0.003 \mathrm{~kg} / \mathrm{s}$. Find the net work input to the cycle.

Energy equation for heat exchanger

$$
\begin{aligned}
\dot{\mathrm{Q}}_{\mathrm{L}} & =\dot{\mathrm{m}}\left(\mathrm{~h}_{2}-\mathrm{h}_{1}\right)=\dot{\mathrm{m}}\left[\mathrm{~h}_{\mathrm{g}}-\left(\mathrm{h}_{\mathrm{f}}+\mathrm{x}_{1} \mathrm{~h}_{\mathrm{fg}}\right)\right] \\
& =\dot{\mathrm{m}}\left[\mathrm{~h}_{\mathrm{fg}}-\mathrm{x}_{1} \mathrm{~h}_{\mathrm{fg}}\right]=\dot{\mathrm{m}}\left(1-\mathrm{x}_{1}\right) \mathrm{h}_{\mathrm{fg}} \\
& =0.003 \mathrm{~kg} / \mathrm{s} \times 0.72 \times 243.65 \mathrm{~kJ} / \mathrm{kg}=0.5263 \mathrm{~kW} \\
\beta & =\mathrm{COP}=\dot{\mathrm{Q}}_{\mathrm{L}} / \dot{\mathrm{W}} \Rightarrow \quad \dot{\mathrm{~W}}=\dot{\mathrm{Q}}_{\mathrm{L}} / \beta=0.5263 / 1.5=\mathbf{0 . 3 5} \mathbf{~ k W}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. For each of the cases below determine if the heat engine satisfies the first law (energy equation) and if it violates the second law.
a. $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=4 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=2 \mathrm{~kW}$
b. $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=0 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=6 \mathrm{~kW}$
c. $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=2 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=5 \mathrm{~kW}$
d. $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=6 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=0 \mathrm{~kW}$

Solution:

|  | $1^{\text {st }}$. law | $2^{\text {nd }}$ law |
| :--- | :--- | :--- |
| a | Yes | Yes (possible) |
| b | Yes | No, impossible Kelvin - Planck |
| c | No | Yes, but energy not conserved |
|  |  |  |
| d | Yes | Yes (Irreversible $\dot{\text { Q }}$ over $\Delta \mathrm{T}$ ) |

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

For each of the cases in problem 7.32 determine if a heat pump satisfies the first law (energy equation) and if it violates the second law.
a. $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=4 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=2 \mathrm{~kW}$
b. $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=0 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=6 \mathrm{~kW}$
c. $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=2 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=5 \mathrm{~kW}$
d. $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=6 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=0 \mathrm{~kW}$

Solution:

$$
1^{\text {st }} \text {. law } \quad 2^{\text {nd }} \text { law }
$$

a Satisfied Does not violate
b Satisfied Does not violate
c Violated
Does not violate, but $1^{\text {st }}$ law
d Satisfied Does violate, Clausius

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A large stationary diesel engine produces 15 MW with a thermal efficiency of $40 \%$. The exhaust gas, which we assume is air, flows out at 800 K and the intake air is 290 K . How large a mass flow rate is that, assuming this is the only way we reject heat? Can the exhaust flow energy be used?

Heat engine: $\dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{W}}_{\text {out }} / \eta_{\mathrm{TH}}=\frac{15}{0.4}=37.5 \mathrm{MW}$

Energy equation: $\quad \dot{\mathrm{Q}}_{\mathrm{L}}=\dot{\mathrm{Q}}_{\mathrm{H}}-\dot{\mathrm{W}}_{\text {out }}=37.5-15=22.5 \mathrm{~kW}$

Exhaust flow: $\quad \dot{\mathrm{Q}}_{\mathrm{L}}=\dot{\mathrm{m}}_{\text {air }}\left(\mathrm{h}_{800}-\mathrm{h}_{290}\right)$

$$
\dot{\mathrm{m}}_{\mathrm{air}}=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\mathrm{~h}_{800}-\mathrm{h}_{290}}=\frac{22.5 \times 1000}{822.2-290.43}=\mathbf{4 2 . 3} \mathbf{~ k g} / \mathbf{s}
$$

The flow of hot gases can be used to heat a building or it can be used to heat water in a steam power plant since that operates at lower temperatures.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.35

In a steam power plant 1 MW is added in the boiler, 0.58 MW is taken out in the condenser and the pump work is 0.02 MW . Find the plant thermal efficiency. If everything could be reversed find the coefficient of performance as a refrigerator.

Solution:

CV. Total plant:

Energy Eq.:
$\dot{\mathrm{Q}}_{\mathrm{H}}+\dot{\mathrm{W}}_{\mathrm{P}, \text { in }}=\dot{\mathrm{W}}_{\mathrm{T}}+\dot{\mathrm{Q}}_{\mathrm{L}}$
$\dot{\mathrm{W}}_{\mathrm{T}}=1+0.02-0.58=0.44 \mathrm{MW}$
$\eta_{\mathrm{TH}}=\frac{\dot{\mathrm{W}}_{\mathrm{T}}-\dot{\mathrm{W}}_{\mathrm{P}, \text { in }}}{\dot{\mathrm{Q}}_{\mathrm{H}}}=\frac{440-20}{1000}=\mathbf{0 . 4 2}$
$\beta=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\dot{\mathrm{W}}_{\mathrm{T}}-\dot{\mathrm{W}}_{\mathrm{P}, \text { in }}}=\frac{580}{440-20}=\mathbf{1 . 3 8}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Calculate the amount of work input a refrigerator needs to make ice cubes out of a tray of 0.25 kg liquid water at $10^{\circ} \mathrm{C}$. Assume the refrigerator has $\beta=3.5$ and a motor-compressor of 750 W . How much time does it take if this is the only cooling load?
C.V. Water in tray. We neglect tray mass.

$$
\begin{array}{ll}
\text { Energy Eq.: } & \mathrm{m}\left(\mathrm{u}_{2}-\mathrm{u}_{1}\right)={ }_{1} \mathrm{Q}_{2}-{ }_{1} \mathrm{~W}_{2} \\
\text { Process : } & \mathrm{P}=\text { constant }=\mathrm{P}_{\mathrm{o}} \\
& { }_{1} \mathrm{~W}_{2}=\int \mathrm{PdV}=\mathrm{P}_{\mathrm{o}} \mathrm{~m}\left(\mathrm{v}_{2}-\mathrm{v}_{1}\right) \\
& { }_{1} \mathrm{Q}_{2}=\mathrm{m}\left(\mathrm{u}_{2}-\mathrm{u}_{1}\right)+{ }_{1} \mathrm{~W}_{2}=\mathrm{m}\left(\mathrm{~h}_{2}-\mathrm{h}_{1}\right)
\end{array}
$$

Tbl. B.1.1 : $\mathrm{h}_{1}=41.99 \mathrm{~kJ} / \mathrm{kg}, ~ T b l$. B. $1.5: \mathrm{h}_{2}=-333.6 \mathrm{~kJ} / \mathrm{kg}$

$$
{ }_{1} Q_{2}=0.25(-333.4-41.99)=-93.848 \mathrm{~kJ}
$$

Consider now refrigerator

$$
\begin{aligned}
& \beta=\mathrm{Q}_{\mathrm{L}} / \mathrm{W} \\
& \mathrm{~W}=\mathrm{Q}_{\mathrm{L}} / \beta=-{ }_{1} \mathrm{Q}_{2} / \beta=93.848 / 3.5=\mathbf{2 6 . 8 1} \mathbf{k J}
\end{aligned}
$$

For the motor to transfer that amount of energy the time is found as

$$
\begin{aligned}
& \mathrm{W}=\int \dot{\mathrm{W}} \mathrm{dt}=\dot{\mathrm{W}} \Delta \mathrm{t} \\
& \Delta \mathrm{t}=\mathrm{W} / \dot{\mathrm{W}}=(26.81 \times 1000) / 750=\mathbf{3 5 . 7 5} \mathbf{~ s}
\end{aligned}
$$

Comment: We neglected a baseload of the refrigerator so not all the 750 W are available to make ice, also our coefficient of performance is very optimistic and finally the heat transfer is a transient process. All this means that it will take much more time to make ice-cubes.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## Second Law and Processes

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Prove that a cyclic device that violates the Kelvin-Planck statement of the second law also violates the Clausius statement of the second law.

Solution: Proof very similar to the proof in section 7.2.
H.E. violating Kelvin receives $\mathrm{Q}_{\mathrm{H}}$ from $\mathrm{T}_{\mathrm{H}}$ and produces net $\mathrm{W}=\mathrm{Q}_{\mathrm{H}}$.

This $W$ input to H.P. receiving $Q_{L}$ from $T_{L}$.
H.P. discharges $Q_{H}+Q_{L}$ to $T_{H}$.

Net $Q$ to $T_{H}$ is : $-Q_{H}+Q_{H}+Q_{L}=Q_{L}$.
H.E. + H.P. together transfers $Q_{L}$ from $T_{L}$
to $\mathrm{T}_{\mathrm{H}}$ with no W thus violates Clausius.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Assume a cyclic machine that exchanges 6 kW with a $250^{\circ} \mathrm{C}$ reservoir and has
a. $\dot{\mathrm{Q}}_{\mathrm{L}}=0 \mathrm{~kW}, \dot{\mathrm{~W}}=6 \mathrm{~kW}$
b. $\dot{\mathrm{Q}}_{\mathrm{L}}=6 \mathrm{~kW}, \dot{\mathrm{~W}}=0 \mathrm{~kW}$
and $\dot{\mathrm{Q}}_{\mathrm{L}}$ is exchanged with a $30^{\circ} \mathrm{C}$ ambient. What can you say about the processes in the two cases $a$ and $b$ if the machine is a heat engine? Repeat the question for the case of a heat pump.
Solution:
Heat engine
a. Since $\dot{\mathrm{Q}}_{\mathrm{L}}=0 \quad$ impossible Kelvin - Planck
b. Possible, irreversible, $\eta_{\text {eng }}=0$

Heat pump
a. Possible, irreversible (like an electric heater)
b. Impossible, $\beta \rightarrow \infty$, Clausius

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.39

Discuss the factors that would make the power plant cycle described in Problem 6.103 an irreversible cycle.

Solution:
General discussion, but here are a few of the most significant factors.

1. Combustion process that generates the hot source of energy.
2. Heat transfer over finite temperature difference in boiler.
3. Flow resistance and friction in turbine results in less work out.
4. Flow friction and heat loss to/from ambient in all pipes.
5. Heat transfer over finite temperature difference in condenser.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Discuss the factors that would make the heat pump described in Problem 6.108 an irreversible cycle.

Solution:

General discussion but here are a few of the most significant factors.

1. Unwanted heat transfer in the compressor.
2. Pressure loss (back flow leak) in compressor
3. Heat transfer and pressure drop in line $1=>2$.
4. Pressure drop in all lines.
5. Throttle process $3=>4$.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Consider the four cases of a heat engine in problem 7.32 and determine if any of those are perpetual machines of the first or second kind.
a. $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=4 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=2 \mathrm{~kW}$
b. $\quad \dot{Q}_{H}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=0 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=6 \mathrm{~kW}$
c. $\quad \dot{Q}_{\mathrm{H}}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=2 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=5 \mathrm{~kW}$
d. $\dot{\mathrm{Q}}_{\mathrm{H}}=6 \mathrm{~kW}, \quad \dot{\mathrm{Q}}_{\mathrm{L}}=6 \mathrm{~kW}, \quad \dot{\mathrm{~W}}=0 \mathrm{~kW}$

Solution:

|  | $1^{\text {st }}$. law | $2^{\text {nd }}$ law |
| :--- | :--- | :--- |
| a | Yes | Yes (possible) |
| b | Yes | No, impossible Kelvin - Planck |
|  |  | Perpetual machine second kind |$]$| It violates the $2^{\text {nd }}$ law converts all $\dot{\mathrm{Q}}$ to $\dot{\mathrm{W}}$ |
| :--- |
|  |
| c |

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. 7.42

Consider a heat engine and heat pump connected as shown in figure P7.42.
Assume $\mathrm{T}_{\mathrm{H} 1}=\mathrm{T}_{\mathrm{H} 2}>\mathrm{T}_{\mathrm{amb}}$ and determine for each of the three cases if the setup satisfy the first law and/or violates the $2^{\text {nd }}$ law.

|  | $\dot{\mathrm{Q}}_{\mathrm{H} 1}$ | $\dot{\mathrm{Q}}_{\mathrm{L} 1}$ | $\dot{\mathrm{~W}}_{1}$ | $\dot{\mathrm{Q}}_{\mathrm{H} 2}$ | $\dot{\mathrm{Q}}_{\mathrm{L} 2}$ | $\dot{\mathrm{~W}}_{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| a | 6 | 4 | 2 | 3 | 2 | 1 |
| b | 6 | 4 | 2 | 5 | 4 | 1 |
| c | 3 | 2 | 1 | 4 | 3 | 1 |

Solution:

|  | $1^{\text {st }}$. law | $2^{\text {nd }}$ law |
| :--- | :--- | :--- |
| a | Yes | Yes (possible) |
| b | Yes | No, combine Kelvin - Planck |
| c | Yes | No, combination clausius |

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

The water in a shallow pond heats up during the day and cools down during the night. Heat transfer by radiation, conduction and convection with the ambient thus cycles the water temperature. Is such a cyclic process reversible or irreversible?

## Solution:

All the heat transfer takes place over a finite $\Delta \mathrm{T}$ and thus all the heat transfer processes are irreversible.
Conduction and convection have $\Delta \mathrm{T}$ in the water, which is internally irreversible and $\Delta \mathrm{T}$ outside the water which is externally irreversible. The radiation is absorbed or given out at the water temperature thus internally (for absorption) and externally (for emission) irreversible.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## Carnot Cycles and Absolute Temperature

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.44

Calculate the thermal efficiency of a Carnot cycle heat engine operating between reservoirs at $300^{\circ} \mathrm{C}$ and $45^{\circ} \mathrm{C}$. Compare the result to that of Problem 7.16.

Solution:

$$
\begin{aligned}
& \eta_{\mathrm{TH}}=\mathrm{W}_{\text {net }} / \mathrm{Q}_{\mathrm{H}}=1-\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=1-\frac{45+273}{300+273}=\mathbf{0 . 4 4 5} \text { (Carnot) } \\
& \eta_{7.16}=0.225 \text { (efficiency about } 1 / 2 \text { of the Carnot) }
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.45

A Carnot cycle heat engine has an efficiency of $40 \%$. If the high temperature is raised $10 \%$ what is the new efficiency keeping the same low temperature?

Solution:

$$
\eta_{\mathrm{TH}}=\mathrm{W}_{\text {net }} / \mathrm{Q}_{\mathrm{H}}=1-\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=0.4 \quad \Rightarrow \quad \frac{\mathrm{~T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=0.6
$$

so if $\mathrm{T}_{\mathrm{H}}$ is raised $10 \%$ the new ratio becomes

$$
\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H} \text { new }}}=0.6 / 1.1=0.5454 \quad \Rightarrow \quad \eta_{\text {TH new }}=1-0.5454=\mathbf{0 . 4 5}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.46

Find the power output and the low T heat rejection rate for a Carnot cycle heat engine that receives 6 kW at $250^{\circ} \mathrm{C}$ and rejects heat at $30^{\circ} \mathrm{C}$ as in Problem 7.38.

Solution:
From the definition of the absolute temperature Eq. 7.8

$$
\eta_{\text {carnot }}=1-\frac{T_{L}}{T_{H}}=1-\frac{303}{523}=0.42
$$

Definition of the heat engine efficiency gives the work as

$$
\dot{\mathrm{W}}=\eta \dot{\mathrm{Q}}_{\mathrm{H}}=0.42 \times 6=\mathbf{2 . 5 2} \mathbf{k W}
$$

Apply the energy equation

$$
\dot{\mathrm{Q}}_{\mathrm{L}}=\dot{\mathrm{Q}}_{\mathrm{H}}-\dot{\mathrm{W}}=6-2.52=\mathbf{3 . 4 8} \mathbf{~ k W}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Consider the setup with two stacked (temperature wise) heat engines as in Fig. P7.4. Let $T_{H}=900 \mathrm{~K}, \mathrm{~T}_{\mathrm{M}}=600 \mathrm{~K}$ and $\mathrm{T}_{\mathrm{L}}=300 \mathrm{~K}$. Find the two heat engine efficiencies and the combined overall efficiency assuming Carnot cycles.

The individual efficiencies

$$
\begin{aligned}
& \eta_{1}=1-\frac{T_{M}}{T_{H}}=1-\frac{600}{900}=\mathbf{0 . 3 3 3} \\
& \eta_{2}=1-\frac{T_{L}}{T_{M}}=1-\frac{300}{600}=\mathbf{0 . 5}
\end{aligned}
$$

The overall efficiency

$$
\eta_{\mathrm{TH}}=\dot{\mathrm{W}}_{\mathrm{net}} / \dot{\mathrm{Q}}_{\mathrm{H}}=\left(\dot{\mathrm{W}}_{1}+\dot{\mathrm{W}}_{2}\right) / \dot{\mathrm{Q}}_{\mathrm{H}}=\eta_{1}+\dot{\mathrm{W}}_{2} / \dot{\mathrm{Q}}_{\mathrm{H}}
$$

For the second heat engine and the energy Eq. for the first heat engine

$$
\dot{\mathrm{W}}_{2}=\eta_{2} \dot{\mathrm{Q}}_{\mathrm{M}}=\eta_{2}\left(1-\eta_{1}\right) \dot{\mathrm{Q}}_{\mathrm{H}}
$$

so the final result is

$$
\eta_{\mathrm{TH}}=\eta_{1}+\eta_{2}\left(1-\eta_{1}\right)=0.333+0.5(1-0.333)=\mathbf{0 . 6 6 7}
$$

Comment: It matches a single heat engine $\eta_{T H}=1-\frac{T_{L}}{T_{H}}=1-\frac{300}{900}=\frac{2}{3}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.48

At a few places where the air is very cold in the winter, like $-30^{\circ} \mathrm{C}$ it is possible to find a temperature of $13^{\circ} \mathrm{C}$ down below ground. What efficiency will a heat engine have operating between these two thermal reservoirs?
Solution:

$$
\eta_{\mathrm{TH}}=1-\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}
$$

The ground becomes the hot source and the atmosphere becomes the cold side of the heat engine
$\eta_{\mathrm{TH}}=1-\frac{273-30}{273+13}=1-\frac{243}{286}=\mathbf{0 . 1 5}$

This is low because of the modest
 temperature difference.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Find the maximum coefficient of performance for the refrigerator in your kitchen, assuming it runs in a Carnot cycle.

Solution:

The refrigerator coefficient of performance is

$$
\beta=Q_{L} / W=Q_{L} /\left(Q_{H}-Q_{L}\right)=T_{L} /\left(T_{H}-T_{L}\right)
$$

Assuming $\quad \mathrm{T}_{\mathrm{L}} \sim 0^{\circ} \mathrm{C}, \quad \mathrm{T}_{\mathrm{H}} \sim 35^{\circ} \mathrm{C}$,

$$
\beta \leq \frac{273.15}{35-0}=7.8
$$

Actual working fluid temperatures must be such that

$$
\mathrm{T}_{\mathrm{L}}<\mathrm{T}_{\text {refrigerator }} \text { and } \mathrm{T}_{\mathrm{H}}>\mathrm{T}_{\text {room }}
$$

A refrigerator does not operate in a Carnot cycle. The actual vapor compression cycle is examined in Chapter 11.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A refrigerator should remove 500 kJ from some food. Assume the refrigerator works in a Carnot cycle between $-10^{\circ} \mathrm{C}$ and $45^{\circ} \mathrm{C}$ with a motor-compressor of 500 W . How much time does it take if this is the only cooling load?

Assume Carnot cycle refrigerator

$$
\beta=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\dot{\mathrm{~W}}}=\dot{\mathrm{Q}}_{\mathrm{L}} /\left(\dot{\mathrm{Q}}_{\mathrm{H}}-\dot{\mathrm{Q}}_{\mathrm{L}}\right) \cong \frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{273-10}{45-(-10)}=4.785
$$

This gives the relation between the low T heat transfer and the work as

$$
\begin{aligned}
& \dot{\mathrm{Q}}_{\mathrm{L}}=\frac{\mathrm{Q}}{\mathrm{t}}=4.785 \dot{\mathrm{~W}} \\
& \mathrm{t}=\frac{\mathrm{Q}}{\beta \dot{\mathrm{~W}}}=\frac{500 \times 1000}{4.785 \times 500}=\mathbf{2 0 9} \mathbf{~ s}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.51

A car engine burns 5 kg fuel (equivalent to addition of $\mathrm{Q}_{\mathrm{H}}$ ) at 1500 K and rejects energy to the radiator and the exhaust at an average temperature of 750 K . If the fuel provides $40000 \mathrm{~kJ} / \mathrm{kg}$ what is the maximum amount of work the engine can provide?

Solution:
A heat engine $Q_{H}=\mathrm{mq}_{\text {fuel }}=5 \times 40000=200000 \mathrm{~kJ}$
Assume a Carnot efficiency (maximum theoretical work)

$$
\begin{aligned}
\eta & =1-\frac{T_{L}}{T_{H}}=1-\frac{750}{1500}=0.5 \\
W & =\eta Q_{H}=\mathbf{1 0 0} \mathbf{0 0 0} \mathbf{~ k J}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.52

A large heat pump should upgrade 5 MW of heat at $85^{\circ} \mathrm{C}$ to be delivered as heat at $150^{\circ} \mathrm{C}$. What is the minimum amount of work (power) input that will drive this?

For the minimum work we assume a Carnot heat pump and $\dot{\mathrm{Q}}_{\mathrm{L}}=5 \mathrm{MW}$.

$$
\begin{aligned}
& \beta_{\mathrm{HP}}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\dot{\mathrm{~W}}_{\mathrm{in}}}=\frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{273.15+150}{150-85}=6.51 \\
& \beta_{\mathrm{REF}}=\beta_{\mathrm{HP}}-1=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\dot{\mathrm{~W}}_{\mathrm{in}}}=5.51
\end{aligned}
$$

Now we can solve for the work

$$
\dot{\mathrm{W}}_{\mathrm{in}}=\dot{\mathrm{Q}}_{\mathrm{L}} / \beta_{\mathrm{REF}}=5 / 5.51=\mathbf{0 . 9 0 7} \mathrm{MW}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.53

An air-conditioner provides $1 \mathrm{~kg} / \mathrm{s}$ of air at $15^{\circ} \mathrm{C}$ cooled from outside atmospheric air at $35^{\circ} \mathrm{C}$. Estimate the amount of power needed to operate the air-conditioner. Clearly state all assumptions made.

## Solution:

Consider the cooling of air which needs a heat transfer as

$$
\dot{\mathrm{Q}}_{\mathrm{air}}=\dot{\mathrm{m}} \Delta \mathrm{~h} \cong \dot{\mathrm{~m}} \mathrm{C}_{\mathrm{p}} \Delta \mathrm{~T}=1 \mathrm{~kg} / \mathrm{s} \times 1.004 \mathrm{~kJ} / \mathrm{kg} \mathrm{~K} \times 20 \mathrm{~K}=20 \mathrm{~kW}
$$

Assume Carnot cycle refrigerator

$$
\begin{aligned}
& \beta=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\dot{\mathrm{~W}}}=\dot{\mathrm{Q}}_{\mathrm{L}} /\left(\dot{\mathrm{Q}}_{\mathrm{H}}-\dot{\mathrm{Q}}_{\mathrm{L}}\right) \cong \frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{273+15}{35-15}=14.4 \\
& \dot{\mathrm{~W}}=\dot{\mathrm{Q}}_{\mathrm{L}} / \beta=\frac{20.0}{14.4}=\mathbf{1 . 3 9} \mathbf{~ k W}
\end{aligned}
$$

This estimate is the theoretical maximum performance. To do the required heat transfer $\mathrm{T}_{\mathrm{L}} \cong 5^{\circ} \mathrm{C}$ and $\mathrm{T}_{\mathrm{H}}=45^{\circ} \mathrm{C}$ are more likely; secondly

$$
\beta<\beta_{\text {carnot }}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.54

A cyclic machine, shown in Fig. P7.54, receives 325 kJ from a 1000 K energy reservoir. It rejects 125 kJ to a 400 K energy reservoir and the cycle produces 200 kJ of work as output. Is this cycle reversible, irreversible, or impossible?

Solution:

$$
\begin{aligned}
& \eta_{\text {Carnot }}=1-\frac{T_{L}}{T_{H}}=1-\frac{400}{1000}=0.6 \\
& \eta_{\text {eng }}=\frac{W}{Q_{H}}=\frac{200}{325}=0.615>\eta_{\text {Carnot }} \\
& \text { This is impossible. }
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.55

A sales person selling refrigerators and deep freezers will guarantee a minimum coefficient of performance of 4.5 year round. How would you evaluate that? Are they all the same?

Solution:
Assume a high temperature of $35^{\circ} \mathrm{C}$. If a freezer compartment is included $T_{L} \sim-20^{\circ} \mathrm{C}$ (deep freezer) and fluid temperature is then $T_{L} \sim-30^{\circ} \mathrm{C}$

$$
\beta_{\text {deep freezer }} \leq \frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{273.15-30}{35-(-30)}=3.74
$$

A hot summer day may require a higher $T_{H}$ to push $Q_{H}$ out into the room, so even lower $\beta$.

Claim is possible for a refrigerator, but not for a deep freezer.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A temperature of about 0.01 K can be achieved by magnetic cooling. In this process a strong magnetic field is imposed on a paramagnetic salt, maintained at 1 K by transfer of energy to liquid helium boiling at low pressure. The salt is then thermally isolated from the helium, the magnetic field is removed, and the salt temperature drops. Assume that 1 mJ is removed at an average temperature of 0.1 K to the helium by a Carnot-cycle heat pump. Find the work input to the heat pump and the coefficient of performance with an ambient at 300 K .

Solution:

$$
\begin{aligned}
& \beta=\dot{\mathrm{Q}}_{\mathrm{L}} / \dot{\mathrm{W}}_{\mathrm{IN}}=\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{0.1}{299.9}=\mathbf{0 . 0 0 0 3 3} \\
& \dot{\mathrm{W}}_{\mathrm{IN}}=\frac{1 \times 10^{-3}}{0.00033}=\mathbf{3} \mathbf{J}
\end{aligned}
$$

Remark: This is an extremely large temperature difference for a heat pump.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

The lowest temperature that has been achieved is about $1 \times 10^{-6} \mathrm{~K}$. To achieve this an additional stage of cooling is required beyond that described in the previous problem, namely nuclear cooling. This process is similar to magnetic cooling, but it involves the magnetic moment associated with the nucleus rather than that associated with certain ions in the paramagnetic salt. Suppose that $10 \mu \mathrm{~J}$ is to be removed from a specimen at an average temperature of $10^{-5} \mathrm{~K}$ (ten microjoules is about the potential energy loss of a pin dropping 3 mm ). Find the work input to a Carnot heat pump and its coefficient of performance to do this assuming the ambient is at 300 K .

Solution:

$$
\begin{aligned}
& Q_{L}=10 \mu \mathrm{~J}=10 \times 10^{-6} \mathrm{~J} \text { at } \mathrm{T}_{\mathrm{L}}=10^{-5} \mathrm{~K} \\
& \Rightarrow \mathrm{Q}_{\mathrm{H}}=\mathrm{Q}_{\mathrm{L}} \times \frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{L}}}=10 \times 10^{-6} \times \frac{300}{10^{-5}}=300 \mathrm{~J} \\
& \mathrm{~W}_{\text {in }}=\mathrm{Q}_{\mathrm{H}}-\mathrm{Q}_{\mathrm{L}}=300-10 \times 10^{-6} \cong \mathbf{3 0 0} \mathbf{J} \\
& \beta=\frac{Q_{L}}{\mathrm{~W}_{\text {in }}}=\frac{10 \times 10^{-6}}{300}=\mathbf{3 . 3 3 \times 1 0 ^ { - 8 }}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

An inventor has developed a refrigeration unit that maintains the cold space at $-10^{\circ} \mathrm{C}$, while operating in a $25^{\circ} \mathrm{C}$ room. A coefficient of performance of 8.5 is claimed. How do you evaluate this?

Solution:

$$
\begin{aligned}
& \beta_{\text {Carnot }}=\frac{\mathrm{Q}_{\mathrm{L}}}{\mathrm{~W}_{\mathrm{in}}}=\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{263.15}{25-(-10)}=7.52 \\
& 8.5>\beta_{\text {Carnot }} \Rightarrow \text { impossible claim }
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Calculate the amount of work input a refrigerator needs to make ice cubes out of a tray of 0.25 kg liquid water at $10^{\circ} \mathrm{C}$. Assume the refrigerator works in a Carnot cycle between $-8^{\circ} \mathrm{C}$ and $35^{\circ} \mathrm{C}$ with a motor-compressor of 750 W . How much time does it take if this is the only cooling load?
Solution:
C.V. Water in tray. We neglect tray mass.

$$
\begin{array}{ll}
\text { Energy Eq.: } & \mathrm{m}\left(\mathrm{u}_{2}-\mathrm{u}_{1}\right)={ }_{1} \mathrm{Q}_{2}-{ }_{1} \mathrm{~W}_{2} \\
\text { Process : } & \mathrm{P}=\text { constant }+\mathrm{P}_{\mathrm{o}} \\
& { }_{1} \mathrm{~W}_{2}=\int \mathrm{PdV}=\mathrm{P}_{\mathrm{o}} \mathrm{~m}\left(\mathrm{v}_{2}-\mathrm{v}_{1}\right) \\
& { }_{1} \mathrm{Q}_{2}=\mathrm{m}\left(\mathrm{u}_{2}-\mathrm{u}_{1}\right)+{ }_{1} \mathrm{~W}_{2}=\mathrm{m}\left(\mathrm{~h}_{2}-\mathrm{h}_{1}\right)
\end{array}
$$

Tbl. B.1.1 : $\mathrm{h}_{1}=41.99 \mathrm{~kJ} / \mathrm{kg}, \quad$ Tbl. B. $1.5: \mathrm{h}_{2}=-333.6 \mathrm{~kJ} / \mathrm{kg}$

$$
{ }_{1} Q_{2}=0.25(-333.4-41.99)=-93.848 \mathrm{~kJ}
$$

Consider now refrigerator

$$
\begin{aligned}
& \beta=\frac{\mathrm{Q}_{\mathrm{L}}}{\mathrm{~W}}=\frac{\mathrm{Q}_{\mathrm{L}}}{\mathrm{Q}_{H}-\mathrm{Q}_{\mathrm{L}}}=\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{273-8}{35-(-8)}=6.16 \\
& \mathrm{~W}=\frac{\mathrm{Q}_{\mathrm{L}}}{\beta}=-\frac{1 \mathrm{Q}_{2}}{\beta}=\frac{93.848}{6.16}=15.24 \mathrm{~kJ}
\end{aligned}
$$

For the motor to transfer that amount of energy the time is found as

$$
\begin{aligned}
& \mathrm{W}=\int \dot{\mathrm{W}} \mathrm{dt}=\dot{\mathrm{W}} \Delta \mathrm{t} \\
& \Delta \mathrm{t}=\frac{\mathrm{W}}{\dot{\mathrm{~W}}}=\frac{15.24 \times 1000}{750}=\mathbf{2 0 . 3} \mathbf{~ s}
\end{aligned}
$$

Comment: We neglected a baseload of the refrigerator so not all the 750 W are available to make ice, also our coefficient of performance is very optimistic and finally the heat transfer is a transient process. All this means that it will take much more time to make ice-cubes.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. ### 7.60

A heat pump receives energy from a source at $80^{\circ} \mathrm{C}$ and delivers energy to a boiler that operates at 350 kPa . The boiler input is saturated liquid water and the exit is saturated vapor both at 350 kPa . The heat pump is driven by a 2.5 MW motor and has a COP that is $60 \%$ of a Carnot heat pump COP. What is the maximum mass flow rate of water the system can deliver?

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{H}}=\mathrm{T}_{\mathrm{sat}}=138.88^{\circ} \mathrm{C}=412 \mathrm{~K}, \quad \mathrm{~h}_{\mathrm{fg}}=2148.1 \mathrm{~kJ} / \mathrm{kg} \\
& \beta_{\mathrm{HP} \text { Carnot }}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\dot{\mathrm{~W}}_{\mathrm{in}}}=\frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{412}{138.88-80}=7 \\
& \beta_{\mathrm{HP} \mathrm{ac}}=0.6 \times 7=4.2=\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{W}}_{\mathrm{in}} \\
& \dot{\mathrm{Q}}_{\mathrm{H}}=4.2 \dot{\mathrm{~W}}_{\mathrm{in}}=4.2 \times 2.5 \mathrm{MW}=10.5 \mathrm{MW}=\dot{\mathrm{m}} \mathrm{~h}_{\mathrm{fg}} \\
& \dot{\mathrm{~m}}=\dot{\mathrm{Q}}_{\mathrm{H}} / \mathrm{h}_{\mathrm{fg}}=10500 \mathrm{~kW} / 2148.1 \mathrm{~kJ} / \mathrm{kg}=\mathbf{4 . 8 9} \mathbf{~ k g} / \mathbf{s}
\end{aligned}
$$

7.61

A household freezer operates in a room at $20^{\circ} \mathrm{C}$. Heat must be transferred from the cold space at a rate of 2 kW to maintain its temperature at $-30^{\circ} \mathrm{C}$. What is the theoretically smallest (power) motor required to operate this freezer?

Solution:

Assume a Carnot cycle between $\mathrm{T}_{\mathrm{L}}=-30^{\circ} \mathrm{C}$ and $\mathrm{T}_{\mathrm{H}}=20^{\circ} \mathrm{C}$ :

$$
\begin{aligned}
& \beta=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\dot{\mathrm{~W}}_{\mathrm{in}}}=\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{273.15-30}{20-(-30)}=4.86 \\
& \dot{\mathrm{~W}}_{\mathrm{in}}=\dot{\mathrm{Q}}_{\mathrm{L}} / \beta=2 / 4.86=\mathbf{0 . 4 1} \mathbf{~ k W}
\end{aligned}
$$

This is the theoretical minimum power input.
Any actual machine requires a larger input.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

We propose to heat a house in the winter with a heat pump. The house is to be maintained at $20^{\circ} \mathrm{C}$ at all times. When the ambient temperature outside drops to $-10^{\circ} \mathrm{C}$, the rate at which heat is lost from the house is estimated to be 25 kW . What is the minimum electrical power required to drive the heat pump?

Solution:

Minimum power if we assume a Carnot cycle

$\dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{Q}}_{\text {leak }}=25 \mathrm{~kW}$

$$
\beta^{\prime}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\dot{\mathrm{~W}}_{\mathrm{IN}}}=\frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{293.2}{30}=9.773 \Rightarrow \quad \dot{\mathrm{~W}}_{\mathrm{IN}}=\frac{25}{9.773}=\mathbf{2 . 5 6} \mathbf{~ k W}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. ### 7.63

A certain solar-energy collector produces a maximum temperature of $100^{\circ} \mathrm{C}$. The energy is used in a cyclic heat engine that operates in a $10^{\circ} \mathrm{C}$ environment. What is the maximum thermal efficiency? What is it, if the collector is redesigned to focus the incoming light to produce a maximum temperature of $300^{\circ} \mathrm{C}$ ?

Solution:

$$
\begin{aligned}
& \text { For } \mathrm{T}_{\mathrm{H}}=100^{\circ} \mathrm{C}=373.2 \mathrm{~K} \quad \& \quad \mathrm{~T}_{\mathrm{L}}=283.2 \mathrm{~K} \\
& \eta_{\text {th max }}=\frac{\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=\frac{90}{373.2}=\mathbf{0 . 2 4 1} \\
& \text { For } \mathrm{T}_{\mathrm{H}}=300^{\circ} \mathrm{C}=573.2 \mathrm{~K} \& \mathrm{~T}_{\mathrm{L}}=283.2 \mathrm{~K} \\
& \eta_{\text {th max }}=\frac{\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=\frac{290}{573.2}=\mathbf{0 . 5 0 6}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Helium has the lowest normal boiling point of any of the elements at 4.2 K . At this temperature the enthalpy of evaporation is $83.3 \mathrm{~kJ} / \mathrm{kmol}$. A Carnot refrigeration cycle is analyzed for the production of 1 kmol of liquid helium at 4.2 K from saturated vapor at the same temperature. What is the work input to the refrigerator and the coefficient of performance for the cycle with an ambient at 300 K ?

## Solution:

For the Carnot cycle the ratio of the heat transfers is the ratio of temperatures

$$
\begin{aligned}
& \mathrm{Q}_{\mathrm{L}}=\mathrm{n} \overline{\mathrm{~h}}_{\mathrm{fg}}=1 \mathrm{kmol} \times 83.3 \mathrm{~kJ} / \mathrm{kmol}=83.3 \mathrm{~kJ} \\
& \mathrm{Q}_{\mathrm{H}}=\mathrm{Q}_{\mathrm{L}} \times \frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{L}}}=83.3 \times \frac{300}{4.2}=5950 \mathrm{~kJ} \\
& \mathrm{~W}_{\mathrm{IN}}=\mathrm{Q}_{\mathrm{H}}-\mathrm{Q}_{\mathrm{L}}=5950-83.3=\mathbf{5 8 8 6 . 7} \mathbf{~ k J} \\
& \beta=\frac{\mathrm{Q}_{\mathrm{L}}}{\mathrm{~W}_{\mathrm{IN}}}=\frac{83.3}{5886.7}=\mathbf{0 . 0 1 4 2} \quad\left[=\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}\right]
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A thermal storage is made with a rock (granite) bed of $2 \mathrm{~m}^{3}$ which is heated to 400 K using solar energy. A heat engine receives a $\mathrm{Q}_{\mathrm{H}}$ from the bed and rejects heat to the ambient at 290 K . The rock bed therefore cools down and as it reaches 290 K the process stops. Find the energy the rock bed can give out. What is the heat engine efficiency at the beginning of the process and what is it at the end of the process?

## Solution:

Assume the whole setup is reversible and that the heat engine operates in a Carnot cycle. The total change in the energy of the rock bed is
$\mathrm{u}_{2}-\mathrm{u}_{1}=\mathrm{q}=\mathrm{C} \Delta \mathrm{T}=0.89(400-290)=97.9 \mathrm{~kJ} / \mathrm{kg}$
$\mathrm{m}=\rho \mathrm{V}=2750 \times 2=5500 \mathrm{~kg}, \quad \mathrm{Q}=\mathrm{mq}=5500 \times 97.9=538450 \mathrm{~kJ}$
To get the efficiency use the CARNOT cycle result as
$\eta=1-T_{0} / T_{H}=1-290 / 400=\mathbf{0 . 2 7 5}$ at the beginning of process
$\eta=1-T_{o} / T_{H}=1-290 / 290=\mathbf{0 . 0}$ at the end of process

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

In a cryogenic experiment you need to keep a container at $-125^{\circ} \mathrm{C}$ although it gains 100 W due to heat transfer. What is the smallest motor you would need for a heat pump absorbing heat from the container and rejecting heat to the room at $20^{\circ} \mathrm{C}$ ?

## Solution:

We do not know the actual device so find the work for a Carnot cycle

$$
\begin{aligned}
& \beta_{\mathrm{REF}}=\dot{\mathrm{Q}}_{\mathrm{L}} / \dot{\mathrm{W}}=\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{148.15}{20-(-125)}=1.022 \\
& \Rightarrow \quad \dot{\mathrm{~W}}=\dot{\mathrm{Q}}_{\mathrm{L}} / \beta_{\mathrm{REF}}=100 / 1.022=\mathbf{9 7 . 8} \mathbf{~ W}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

It is proposed to build a $1000-\mathrm{MW}$ electric power plant with steam as the working fluid. The condensers are to be cooled with river water (see Fig. P7.67). The maximum steam temperature is $550^{\circ} \mathrm{C}$, and the pressure in the condensers will be 10 kPa . Estimate the temperature rise of the river downstream from the power plant.

Solution:

$$
\begin{aligned}
& \dot{\mathrm{W}}_{\mathrm{NET}}=10^{6} \mathrm{~kW}, \quad \mathrm{~T}_{\mathrm{H}}=550^{\circ} \mathrm{C}=823.3 \mathrm{~K} \\
& \mathrm{P}_{\mathrm{COND}}=10 \mathrm{kPa} \rightarrow \mathrm{~T}_{\mathrm{L}}=\mathrm{T}_{\mathrm{G}}(\mathrm{P}=10 \mathrm{kPa})=45.8^{\circ} \mathrm{C}=319 \mathrm{~K} \\
& \eta_{\text {TH CARNOT }}=\frac{\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=\frac{823.2-319}{823.2}=0.6125 \\
& \Rightarrow \dot{\mathrm{Q}}_{\mathrm{L} \text { MIN }}=10^{6}\left(\frac{1-0.6125}{0.6125}\right)=0.6327 \times 10^{6} \mathrm{~kW}
\end{aligned}
$$

But $\dot{\mathrm{m}}_{\mathrm{H}_{2} \mathrm{O}}=\frac{60 \times 8 \times 10 / 60}{0.001}=80000 \mathrm{~kg} / \mathrm{s}$ having an energy flow of

$$
\begin{aligned}
& \dot{\mathrm{Q}}_{\mathrm{L} \mathrm{MIN}}=\dot{\mathrm{m}}_{\mathrm{H}_{2} \mathrm{O}} \Delta \mathrm{~h}=\dot{\mathrm{m}}_{\mathrm{H}_{2} \mathrm{O}} \mathrm{C}_{\mathrm{P} \mathrm{LIQ} \mathrm{H}}^{2} \mathrm{O} \\
& \Delta \mathrm{~T}_{\mathrm{H}_{2} \mathrm{O} \mathrm{MIN}} \\
& \Rightarrow \Delta \mathrm{~T}_{\mathrm{H}_{2} \mathrm{O} \mathrm{MIN}}=\frac{\dot{\mathrm{Q}}_{\mathrm{L} \mathrm{MIN}}}{\dot{\mathrm{~m}}_{\mathrm{H}_{2} \mathrm{O}} \mathrm{C}_{\mathrm{P} \mathrm{LIQ} \mathrm{H}}^{2}} \\
& \mathrm{O}
\end{aligned}=\frac{0.6327 \times 10^{6}}{80000 \times 4.184}=\mathbf{1 . 9}{ }^{\circ} \mathbf{C}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. A steel bottle $V=0.1 \mathrm{~m}^{3}$ contains $\mathrm{R}-134 \mathrm{a}$ at $20^{\circ} \mathrm{C}, 200 \mathrm{kPa}$. It is placed in a deep freezer where it is cooled to $-20^{\circ} \mathrm{C}$. The deep freezer sits in a room with ambient temperature of $20^{\circ} \mathrm{C}$ and has an inside temperature of $-20^{\circ} \mathrm{C}$. Find the amount of energy the freezer must remove from the R-134a and the extra amount of work input to the freezer to do the process.

Solution:
C.V. R-134a out to the $-20^{\circ} \mathrm{C}$ space.

Energy equation: $m\left(u_{2}-u_{1}\right)={ }_{1} Q_{2}-{ }_{1} W_{2}$
Process: V $=$ Const $\quad \Rightarrow v_{2}=v_{1} \quad \Rightarrow{ }_{1} W_{2}=0$
Table B.5.2: $\quad \mathrm{v}_{1}=0.11436 \mathrm{~m}^{3} / \mathrm{kg}, \quad \mathrm{u}_{1}=395.27 \mathrm{~kJ} / \mathrm{kg}$ $\mathrm{m}=\mathrm{V} / \mathrm{v}_{1}=0.87443 \mathrm{~kg}$
State 2: $\mathrm{v}_{2}=\mathrm{v}_{1}<\mathrm{v}_{\mathrm{g}}=0.14649$ Table B.5.1 $\Rightarrow 2$ phase

$$
\begin{aligned}
& \Rightarrow x_{2}=\frac{v-v_{f}}{v_{f g}}=\frac{0.11436-0.000738}{0.14576}=0.77957 \\
& u_{2}=173.65+0.77957 \times 192.85=323.99 \mathrm{~kJ} / \mathrm{kg} \\
&{ }_{1} Q_{2}=m\left(u_{2}-u_{1}\right)=\mathbf{- 6 2 . 3 3 4} \mathbf{~ k J}
\end{aligned}
$$

Consider the freezer and assume Carnot cycle

$$
\begin{aligned}
& \beta=\frac{Q_{L}}{W}=\frac{Q_{L}}{Q_{H}-Q_{L}}=\frac{T_{L}}{T_{H}-T_{L}}=\frac{273-20}{20-(-20)}=6.33 \\
& W_{\text {in }}=Q_{L} / \beta=62.334 / 6.33=\mathbf{9 . 8 5} \mathbf{k J}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Sixty kilograms per hour of water runs through a heat exchanger, entering as saturated liquid at 200 kPa and leaving as saturated vapor. The heat is supplied by a Carnot heat pump operating from a low-temperature reservoir at $16^{\circ} \mathrm{C}$. Find the rate of work into the heat pump.

Solution:
C.V. Heat exchanger

$$
\dot{\mathrm{m}}_{1}=\dot{\mathrm{m}}_{2} ; \quad \dot{\mathrm{m}}_{1} \mathrm{~h}_{1}+\dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{m}}_{1} \mathrm{~h}_{2}
$$

Table B.1.2: $\mathrm{h}_{1}=504.7 \mathrm{~kJ} / \mathrm{kg}$,
$\mathrm{h}_{2}=2706.7 \mathrm{~kJ} / \mathrm{kg}$
$\mathrm{T}_{\mathrm{H}}=\mathrm{T}_{\text {sat }}(\mathrm{P})=120.93+273.15$
$=394.08 \mathrm{~K}$

$$
\dot{\mathrm{Q}}_{\mathrm{H}}=\frac{60}{3600}(2706.7-504.7)=36.7 \mathrm{~kW}
$$

Assume a Carnot heat pump.

$$
\begin{aligned}
& \beta^{\prime}=\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{W}}=\mathrm{T}_{\mathrm{H}} /\left(\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)=394.08 / 104.93=3.76 \\
& \dot{\mathrm{~W}}=\dot{\mathrm{Q}}_{\mathrm{H}} / \beta^{\prime}=36.7 / 3.76=\mathbf{9 . 7 6} \mathbf{~ k W}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. 7.71

A heat engine has a solar collector receiving 0.2 kW per square meter inside which a transfer media is heated to 450 K . The collected energy powers a heat engine which rejects heat at $40^{\circ} \mathrm{C}$. If the heat engine should deliver 2.5 kW what is the minimum size (area) solar collector?

Solution:

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{H}}=450 \mathrm{~K} \quad \mathrm{~T}_{\mathrm{L}}=40^{\circ} \mathrm{C}=313.15 \mathrm{~K} \\
& \eta_{\mathrm{HE}}=1-\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=1-\frac{313.15}{450}=0.304 \\
& \dot{\mathrm{~W}}=\eta \dot{\mathrm{Q}}_{\mathrm{H}} \Rightarrow \quad \dot{\mathrm{Q}}_{\mathrm{H}}=\frac{\dot{\mathrm{W}}}{\eta}=\frac{2.5}{0.304}=8.224 \mathrm{~kW} \\
& \dot{\mathrm{Q}}_{\mathrm{H}}=0.2 \mathrm{~A} \Rightarrow \mathrm{~A}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{0.2}=41 \mathbf{~ m}^{2}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Liquid sodium leaves a nuclear reactor at $800^{\circ} \mathrm{C}$ and is used as the energy source in a steam power plant. The condenser cooling water comes from a cooling tower at $15^{\circ} \mathrm{C}$. Determine the maximum thermal efficiency of the power plant. Is it misleading to use the temperatures given to calculate this value?

Solution:

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{H}}=800^{\circ} \mathrm{C}=1073.2 \mathrm{~K}, \quad \mathrm{~T}_{\mathrm{L}}=15^{\circ} \mathrm{C}=288.2 \mathrm{~K} \\
& \eta_{\text {TH MAX }}=\frac{\mathrm{T}_{H}-\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=\frac{1073.2-288.2}{1073.2}=\mathbf{0 . 7 3 1}
\end{aligned}
$$

It might be misleading to use $800^{\circ} \mathrm{C}$ as the value for $\mathrm{T}_{\mathrm{H}}$, since there is not a supply of energy available at a constant temperature of $800^{\circ} \mathrm{C}$ (liquid Na is cooled to a lower temperature in the heat exchanger).

$$
\Rightarrow \quad \text { The Na cannot be used to boil } \mathrm{H}_{2} \mathrm{O} \text { at } 800^{\circ} \mathrm{C} .
$$

Similarly, the $\mathrm{H}_{2} \mathrm{O}$ leaves the cooling tower and enters the condenser at $15^{\circ} \mathrm{C}$, and leaves the condenser at some higher temperature.
$\Rightarrow \quad$ The water does not provide for condensing steam at a
constant temperature of $15^{\circ} \mathrm{C}$.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.73

A power plant with a thermal efficiency of $40 \%$ is located on a river similar to Fig. P7.67. With a total river mass flow rate of $1 \times 10^{5} \mathrm{~kg} / \mathrm{s}$ at $15^{\circ} \mathrm{C}$ find the maximum power production allowed if the river water should not be heated more than 1 degree.

The maximum heating allowed determines the maximum $\dot{\mathrm{Q}}_{\mathrm{L}}$ as

$$
\begin{aligned}
& \dot{\mathrm{Q}}_{\mathrm{L}}=\dot{\mathrm{m}}_{\mathrm{H}_{2} \mathrm{O}} \Delta \mathrm{~h}=\dot{\mathrm{m}}_{\mathrm{H}_{2} \mathrm{O}} \mathrm{C}_{\mathrm{P} \mathrm{LIQ} \mathrm{H}}^{2} \mathrm{O} ~ \Delta \mathrm{~T}_{\mathrm{H}_{2} \mathrm{O}} \\
& =1 \times 10^{5} \mathrm{~kg} / \mathrm{s} \times 4.18 \mathrm{~kJ} / \mathrm{kg}-\mathrm{K} \times 1 \mathrm{~K}=418 \mathrm{MW} \\
& =\dot{\mathrm{W}}_{\mathrm{NET}}{ }^{\left(1 / \eta_{\mathrm{TH} \mathrm{ac}}\right.}{ }^{-1)} \\
& \dot{\mathrm{W}}_{\mathrm{NET}}=\dot{\mathrm{Q}}_{\mathrm{L}} /\left(1 / \eta_{\mathrm{TH} \mathrm{ac}}-1\right)=\dot{\mathrm{Q}}_{\mathrm{L}} \frac{\eta_{\mathrm{TH} \mathrm{ac}}}{1-\eta_{\mathrm{TH} \mathrm{ac}}} \\
& =418 \mathrm{MW} \times \frac{0.4}{1-0.4}=\mathbf{2 7 9} \mathbf{~ M W}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A heat pump is driven by the work output of a heat engine as shown in figure P7.74. If we assume ideal devices find the ratio of the total power $\dot{\mathrm{Q}}_{\mathrm{L} 1}+\dot{\mathrm{Q}}_{\mathrm{H} 2}$ that heats the house to the power from the hot energy source $\dot{\mathrm{Q}}_{\mathrm{H} 1}$ in terms of the temperatures.

$$
\begin{aligned}
& \beta_{\mathrm{HP}}=\dot{\mathrm{Q}}_{\mathrm{H} 2} / \dot{\mathrm{W}}=\dot{\mathrm{Q}}_{\mathrm{H} 2} /\left(\dot{\mathrm{Q}}_{\mathrm{H} 2}-\dot{\mathrm{Q}}_{\mathrm{L} 2}\right)=\frac{\mathrm{T}_{\text {room }}}{\mathrm{T}_{\text {room }}-\mathrm{T}_{\mathrm{amb}}} \\
& \dot{\mathrm{~W}}=\eta_{\mathrm{HE}} \cdot \dot{\mathrm{Q}}_{\mathrm{H} 1}=\left(1-\frac{\mathrm{T}_{\text {room }}}{\mathrm{T}_{\mathrm{H}}}\right) \dot{\mathrm{Q}}_{\mathrm{H} 1} \\
& \dot{\mathrm{~W}}=\dot{\mathrm{Q}}_{\mathrm{H} 2} / \beta_{\mathrm{HP}}=\frac{\mathrm{T}_{\text {room }}}{\mathrm{T}_{\text {room }}-\mathrm{T}_{\mathrm{amb}}} \dot{\mathrm{Q}}_{\mathrm{H} 2} \\
& \dot{\mathrm{Q}}_{\mathrm{L} 1}=\dot{\mathrm{Q}}_{\mathrm{H1}}{ }^{-} \dot{\mathrm{W}}=\left[1-1+\frac{\mathrm{T}_{\text {room }}}{\mathrm{T}_{\mathrm{H}}}\right] \dot{\mathrm{Q}}_{\mathrm{H} 1} \\
& \frac{\dot{\mathrm{Q}}_{\mathrm{H} 2}+\dot{\mathrm{Q}}_{\mathrm{L} 1}}{\dot{\mathrm{Q}}_{\mathrm{H} 1}}=1-1+\frac{\mathrm{T}_{\text {room }}}{\mathrm{T}_{\mathrm{H}}}+\frac{1-\frac{\mathrm{T}_{\text {room }}}{\mathrm{T}_{\mathrm{H}}}}{\frac{\mathrm{~T}_{\text {room }}-\mathrm{T}_{\mathrm{amb}}}{T_{\text {room }}}}=\frac{\mathrm{T}_{\text {room }}}{\mathrm{T}_{\mathrm{H}}}+\frac{\mathrm{T}_{\text {room }}-\mathrm{T}^{2}{ }_{\text {room }} / \mathrm{T}_{H}}{\mathrm{~T}_{\text {room }}-\mathrm{T}_{\mathrm{amb}}} \\
& =\mathrm{T}_{\text {room }}\left[\frac{1}{\mathrm{~T}_{\mathrm{H}}}+\frac{1-\frac{\mathrm{T}_{\text {room }}}{\mathrm{T}_{H}}}{\mathrm{~T}_{\text {room }}-\mathrm{T}_{\text {amb }}}\right]=\frac{\mathrm{T}_{\text {room }}}{\mathrm{T}_{\mathrm{H}}}\left[1+\frac{\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\text {room }}}{\mathrm{T}_{\text {room }}-\mathrm{T}_{\text {amb }}}\right] \\
& =\frac{T_{\text {room }}}{T_{H}}\left[\frac{T_{H}-T_{\text {amb }}}{T_{\text {room }}-T_{a m b}}\right]
\end{aligned}
$$

A car engine with a thermal efficiency of $33 \%$ drives the air-conditioner unit (a refrigerator) besides powering the car and other auxiliary equipment. On a hot $\left(35^{\circ} \mathrm{C}\right)$ summer day the $\mathrm{A} / \mathrm{C}$ takes outside air in and cools it to $5^{\circ} \mathrm{C}$ sending it into a duct using 2 kW of power input and it is assumed to be half as good as a Carnot refrigeration unit. Find the rate of fuel $(\mathrm{kW})$ being burned extra just to drive the $\mathrm{A} / \mathrm{C}$ unit and its COP. Find the flow rate of cold air the A/C unit can provide.

$$
\begin{aligned}
& \dot{\mathrm{W}}_{\text {extra }}=\eta \dot{\mathrm{Q}}_{\mathrm{H} \text { extra }} \Rightarrow \dot{\mathrm{Q}}_{\mathrm{H} \mathrm{extra}}=\dot{\mathrm{W}}_{\text {extra }} / \eta=2 \mathrm{~kW} / 0.33=\mathbf{6} \mathbf{~ k W} \\
& \beta=\frac{\mathrm{Q}_{\mathrm{L}}}{\mathrm{~W}_{\mathrm{IN}}}=0.5 \beta_{\text {Carnot }}=0.5 \frac{\mathrm{~T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=0.5 \frac{5+273.15}{35-5}=4.636 \\
& \dot{\mathrm{Q}}_{\mathrm{L}}=\beta \dot{\mathrm{W}}=4.636 \times 2 \mathrm{~kW}=9.272 \mathrm{~kW}=\dot{\mathrm{m}}_{\text {air }} \mathrm{C}_{\mathrm{P} \text { air }} \Delta \mathrm{T}_{\text {air }} \\
& \dot{\mathrm{m}}_{\text {air }}=\dot{\mathrm{Q}}_{\mathrm{L}} /\left[\mathrm{C}_{\mathrm{P} \text { air }} \Delta \mathrm{T}_{\text {air }}\right]=\frac{9.272 \mathrm{~kW}}{1.004 \mathrm{~kJ} / \mathrm{kg}-\mathrm{K} \times(35-5) \mathrm{K}}=\mathbf{0 . 3 0 8} \mathbf{~ k g} / \mathbf{s}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Two different fuels can be used in a heat engine operating between the fuel burning temperature and a low temperature of 350 K . Fuel A burns at 2200 K delivering $30000 \mathrm{~kJ} / \mathrm{kg}$ and costs $\$ 1.50 / \mathrm{kg}$. Fuel B burns at 1200 K , delivering $40000 \mathrm{~kJ} / \mathrm{kg}$ and costs $\$ 1.30 / \mathrm{kg}$. Which fuel will you buy and why?

Solution:
Fuel A: $\quad \eta_{T H, A}=1-\frac{T_{L}}{T_{H}}=1-\frac{350}{2200}=0.84$

$$
\mathrm{W}_{\mathrm{A}}=\eta_{\mathrm{TH}, \mathrm{~A}} \times \mathrm{Q}_{\mathrm{A}}=0.84 \times 30000=25200 \mathrm{~kJ} / \mathrm{kg}
$$

$$
\mathrm{W}_{\mathrm{A}} / \$_{\mathrm{A}}=25200 / 1.5=16800 \mathrm{~kJ} / \$
$$

Fuel B: $\quad \eta_{T H, B}=1-\frac{T_{L}}{T_{H}}=1-\frac{350}{1200}=0.708$
$W_{B}=\eta_{T H, B} \times Q_{B}=0.708 \times 40000=28320 \mathrm{~kJ} / \mathrm{kg}$
$\mathrm{W}_{\mathrm{B}} / \$_{\mathrm{B}}=28320 / 1.3=21785 \mathrm{~kJ} / \mathrm{\$}$
Select fuel B for more work per dollar though it has a lower thermal efficiency.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. A large heat pump should upgrade 5 MW of heat at $85^{\circ} \mathrm{C}$ to be delivered as heat at $150^{\circ} \mathrm{C}$. Suppose the actual heat pump has a COP of 2.5 how much power is required to drive the unit. For the same COP how high a high temperature would a Carnot heat pump have assuming the same low T?

This is an actual COP for the heat pump as

$$
\begin{aligned}
& \beta_{\mathrm{HP}}=\mathrm{COP}=\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{W}}_{\mathrm{in}}=2.5 \Rightarrow \dot{\mathrm{Q}}_{\mathrm{L}} / \dot{\mathrm{W}}_{\mathrm{in}}=1.5 \\
& \dot{\mathrm{~W}}_{\mathrm{in}}=\dot{\mathrm{Q}}_{\mathrm{L}} / 1.5=5 / 1.5=3.333 \mathbf{M W}
\end{aligned}
$$

The Carnot heat pump has a COP given by the temperatures as

$$
\begin{aligned}
& \beta_{\mathrm{HP}}=\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{W}}_{\mathrm{in}}=\frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=2.5 \Rightarrow \mathrm{~T}_{\mathrm{H}}=2.5 \mathrm{~T}_{\mathrm{H}}-2.5 \mathrm{~T}_{\mathrm{L}} \\
& \Rightarrow \quad \mathrm{~T}_{\mathrm{H}}=\frac{2.5}{1.5} \mathrm{~T}_{\mathrm{L}}=\frac{5}{3}(85+273.15)=\mathbf{5 9 7} \mathbf{K}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

## Finite $\Delta T$ Heat Transfer

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

The ocean near Havaii has $20^{\circ} \mathrm{C}$ near the surface and $5^{\circ} \mathrm{C}$ at some depth. A power plant based on this temperature difference is being planned. How large an efficiency could it have? If the two heat transfer terms $\left(\mathrm{Q}_{\mathrm{H}}\right.$ and $\left.\mathrm{Q}_{\mathrm{L}}\right)$ both require a 2 degree difference to operate what is the maximum efficiency then?

Solution:

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{H}}=20^{\circ} \mathrm{C}=293.2 \mathrm{~K} ; \quad \mathrm{T}_{\mathrm{L}}=5^{\circ} \mathrm{C}=278.2 \mathrm{~K} \\
& \eta_{\mathrm{TH} \operatorname{MAX}}=\frac{\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=\frac{293.2-278.2}{293.2}=\mathbf{0 . 0 5 1} \\
& \eta_{\mathrm{TH} \bmod }=\frac{\mathrm{T}_{\mathrm{H}^{\prime}}-\mathrm{T}_{\mathrm{L}^{\prime}}}{\mathrm{T}_{\mathrm{H}^{\prime}}}=\frac{291.2-280.2}{291.2}=\mathbf{0 . 0 3 8}
\end{aligned}
$$

This is a very low efficiency so it has to be done on a very large scale to be economically feasible and then it will have some environmental impact.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A refrigerator keeping $5^{\circ} \mathrm{C}$ inside is located in a $30^{\circ} \mathrm{C}$ room. It must have a high temperature $\Delta \mathrm{T}$ above room temperature and a low temperature $\Delta \mathrm{T}$ below the refrigerated space in the cycle to actually transfer the heat. For a $\Delta \mathrm{T}$ of 0,5 and $10^{\circ} \mathrm{C}$ respectively calculate the COP assuming a Carnot cycle.

Solution:
From the definition of COP and assuming Carnot cycle

$$
\beta=\frac{Q_{L}}{W_{I N}}=\frac{T_{L}}{T_{H}-T_{L}} \quad \text { when T's are absolute temperatures }
$$

|  | $\Delta \mathrm{T}$ | $\mathrm{T}_{\mathrm{H}}$ | $\mathrm{T}_{\mathrm{H}}$ | $\mathrm{T}_{\mathrm{L}}$ | $\mathrm{T}_{\mathrm{L}}$ | $\beta$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | ${ }^{\circ} \mathrm{C}$ | K | ${ }^{\circ} \mathrm{C}$ | $\mathrm{K}^{\circ}$ |  |
| a | 0 | 30 | 303 | 5 | 278 | 11.1 |
| b | 5 | 35 | 308 | 0 | 273 | 7.8 |
| c | 10 | 40 | 313 | -5 | 268 | 5.96 |

Notice how the COP drops significantly with the increase in $\Delta \mathrm{T}$.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A house is heated by a heat pump driven by an electric motor using the outside as the low-temperature reservoir. The house loses energy directly proportional to the temperature difference as $\dot{\mathrm{Q}}_{\mathrm{loss}}=\mathrm{K}\left(\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)$. Determine the minimum electric power to drive the heat pump as a function of the two temperatures.

## Solution:

Heat pump COP: $\quad \beta^{\prime}=\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{W}}_{\mathrm{in}} \leq \mathrm{T}_{\mathrm{H}} /\left(\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)$;
Heat loss must be added: $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{Q}}_{\text {loss }}=\mathrm{K}\left(\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)$
Solve for required work and substitute in for $\beta^{\prime}$

$$
\begin{aligned}
& \dot{\mathrm{W}}_{\mathrm{in}}=\dot{\mathrm{Q}}_{\mathrm{H}} / \beta^{\prime} \geq \mathrm{K}\left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right) \times\left(\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right) / \mathrm{T}_{\mathrm{H}} \\
& \dot{\mathrm{~W}}_{\mathrm{in}} \geq \mathrm{K}\left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)^{2} / \mathrm{T}_{\mathrm{H}}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. ### 7.81

A house is heated by an electric heat pump using the outside as the lowtemperature reservoir. For several different winter outdoor temperatures, estimate the percent savings in electricity if the house is kept at $20^{\circ} \mathrm{C}$ instead of $24^{\circ} \mathrm{C}$. Assume that the house is losing energy to the outside as in Eq. 7.14.

Solution:

$$
\begin{aligned}
& \text { Heat Pump } \dot{\mathrm{Q}}_{\text {loss }} \propto\left(\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right) \\
& \operatorname{Max}_{\text {Perf. }} \frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\dot{\mathrm{~W}}_{\mathrm{IN}}}=\frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{\mathrm{K}\left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)}{\dot{\mathrm{W}}_{\mathrm{IN}}}, \quad \dot{\mathrm{~W}}_{\mathrm{IN}}=\frac{\mathrm{K}\left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)^{2}}{\mathrm{~T}_{\mathrm{H}}} \\
&
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.82

A car engine operates with a thermal efficiency of $35 \%$. Assume the airconditioner has a coefficient of performance of $\beta=3$ working as a refrigerator cooling the inside using engine shaft work to drive it. How much fuel energy should be spend extra to remove 1 kJ from the inside?

Solution:

$$
\begin{aligned}
& \text { Car engine: } \quad \begin{array}{l}
\mathrm{W}=\eta_{\text {eng }} \mathrm{Q}_{\text {fuel }} \\
\text { Air conditioner: } \quad \beta=\frac{\mathrm{Q}_{\mathrm{L}}}{\mathrm{~W}} \\
\mathrm{~W}=\eta_{\text {eng }} \mathrm{Q}_{\text {fuel }}=\frac{\mathrm{Q}_{\mathrm{L}}}{\beta} \\
\mathrm{Q}_{\text {fuel }}=\mathrm{Q}_{\mathrm{L}} /\left(\eta_{\text {eng }} \beta\right)=\frac{1}{0.35 \times 3}=\mathbf{0 . 9 5 2} \mathbf{~ k J}
\end{array}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.83

A refrigerator uses a power input of 2.5 kW to cool a $5^{\circ} \mathrm{C}$ space with the high temperature in the cycle as $50^{\circ} \mathrm{C}$. The $\mathrm{Q}_{\mathrm{H}}$ is pushed to the ambient air at $35^{\circ} \mathrm{C}$ in a heat exchanger where the transfer coefficient is $50 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$. Find the required minimum heat transfer area.

Solution:

$$
\begin{aligned}
& \dot{\mathrm{W}}=2.5 \mathrm{~kW}=\dot{\mathrm{Q}}_{\mathrm{H}} / \beta_{\mathrm{HP}} \\
& \dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{W}} \times \beta_{\mathrm{HP}}=2.5 \times[323 /(50-5)]=17.95 \mathrm{~kW}=\mathrm{h} \mathrm{~A} \Delta \mathrm{~T} \\
& \mathrm{~A}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\mathrm{~h} \Delta \mathrm{~T}}=\frac{17.95 \times 10^{3}}{50 \times 15}=\mathbf{2 3 . 9} \mathbf{~ m}^{2}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A heat pump has a coefficient of performance that is $50 \%$ of the theoretical maximum. It maintains a house at $20^{\circ} \mathrm{C}$, which leaks energy of 0.6 kW per degree temperature difference to the ambient. For a maximum of 1.0 kW power input find the minimum outside temperature for which the heat pump is a sufficient heat source.

Solution:

C.V. House. For constant $20^{\circ} \mathrm{C}$ the heat pump must provide $\dot{\mathrm{Q}}_{\text {leak }}=0.6 \Delta \mathrm{~T}$

$$
\dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{Q}}_{\text {leak }}=0.6\left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)=\beta^{\prime} \dot{\mathrm{W}}
$$

C.V. Heat pump. Definition of the coefficient of performance and the fact that the maximum is for a Carnot heat pump.

$$
\beta^{\prime}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\dot{\mathrm{~W}}}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\dot{\mathrm{Q}}_{\mathrm{H}}-\dot{\mathrm{Q}}_{\mathrm{L}}}=0.5 \beta_{\text {Carnot }}^{\prime}=0.5 \times \frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}
$$

Substitute into the first equation to get

$$
\begin{aligned}
& 0.6\left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)=\left[0.5 \times \mathrm{T}_{\mathrm{H}} /\left(\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)\right] 1 \quad \mathrm{P} \\
& \left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)^{2}=(0.5 / 0.6) \mathrm{T}_{\mathrm{H}} \times 1=0.5 / 0.6 \times 293.15=244.29 \\
& \mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}=15.63=>\mathrm{T}_{\mathrm{L}}=20-15.63=4.4{ }^{\circ} \mathbf{C}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Consider a room at $20^{\circ} \mathrm{C}$ that is cooled by an air conditioner with a COP of 3.2 using a power input of 2 kW and the outside is at $35^{\circ} \mathrm{C}$. What is the constant in the heat transfer Eq. 7.14 for the heat transfer from the outside into the room?

$$
\dot{\mathrm{Q}}_{\mathrm{L}}=\beta_{\mathrm{AC}} \dot{\mathrm{~W}}=3.2 \times 2 \mathrm{~kW}=6.4 \mathrm{~kW}=\dot{\mathrm{Q}}_{\text {leak in }}=\mathrm{CA} \Delta \mathrm{~T}
$$

$$
\mathrm{CA}=\dot{\mathrm{Q}}_{\mathrm{L}} / \Delta \mathrm{T}=\frac{6.4 \mathrm{~kW}}{(35-20) \mathrm{K}}=\mathbf{0 . 4 2 7} \mathbf{~ k W} / \mathbf{K}
$$

Here:

$$
\begin{aligned}
\mathrm{T}_{\mathrm{L}} & =\mathrm{T}_{\text {house }}=20^{\circ} \mathrm{C} \\
\mathrm{~T}_{\mathrm{H}} & =\mathrm{T}_{\mathrm{amb}}=35^{\circ} \mathrm{C}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A farmer runs a heat pump with a motor of 2 kW . It should keep a chicken hatchery at $30^{\circ} \mathrm{C}$ which loses energy at a rate of 0.5 kW per degree difference to the colder ambient. The heat pump has a coefficient of performance that is $50 \%$ of a Carnot heat pump. What is the minimum ambient temperature for which the heat pump is sufficient?

## Solution:

C.V. Hatchery, steady state.

To have steady state at $30^{\circ} \mathrm{C}$ for the hatchery
Energy Eq.: $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{Q}}_{\text {Loss }}=\beta_{\mathrm{AC}} \dot{\mathrm{W}}$
Process Eq.: $\quad \dot{\mathrm{Q}}_{\text {Loss }}=0.5\left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{amb}}\right) ; \quad \beta_{\mathrm{AC}}=1 / 2 \beta_{\text {CARNOT }}$
COP for the reference Carnot heat pump

$$
\beta_{\text {CARNOT }}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\dot{\mathrm{~W}}}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\dot{\mathrm{Q}}_{\mathrm{H}}-\dot{\mathrm{Q}}_{\mathrm{L}}}=\frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{amb}}}
$$

Substitute the process equations and this $\beta_{\text {CARNOT }}$ into the energy Eq.

$$
\begin{aligned}
& 0.5\left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{amb}}\right)=1 / 2 \frac{\mathrm{~T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{amb}}} \dot{\mathrm{~W}} \\
& \left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{amb}}\right)^{2}=1 / 2 \mathrm{~T}_{\mathrm{H}} \dot{\mathrm{~W}} / 0.5=\mathrm{T}_{\mathrm{H}} \dot{\mathrm{~W}}=(273+30) \times 2=606 \mathrm{~K}^{2} \\
& \mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{amb}}=24.62 \mathrm{~K} \\
& \mathrm{~T}_{\mathrm{amb}}=30-24.62=\mathbf{5 . 3 8}^{\mathbf{0}} \mathbf{C}
\end{aligned}
$$

Comment: That of course is not a very low temperature and the size of the system is not adequate for most locations.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

An air conditioner cools a house at $\mathrm{T}_{\mathrm{L}}=20^{\circ} \mathrm{C}$ with a maximum of 1.2 kW power input. The house gains 0.6 kW per degree temperature difference to the ambient and the refrigeration COP is $\beta=0.6 \beta_{\text {Carnot }}$. Find the maximum outside temperature, $\mathrm{T}_{\mathrm{H}}$, for which the air conditioner provides sufficient cooling.

Solution:

Here:

$$
\begin{aligned}
\mathrm{T}_{\mathrm{L}} & =\mathrm{T}_{\text {house }} \\
\mathrm{T}_{\mathrm{H}} & =\mathrm{T}_{\mathrm{amb}}
\end{aligned}
$$

In this setup the low temperature space is the house and the high temperature space is the ambient. The heat pump must remove the gain or leak heat transfer to keep it at a constant temperature.

$$
\begin{aligned}
\dot{\mathrm{Q}}_{\text {leak }} & =0.6\left(\mathrm{~T}_{\mathrm{amb}}-\mathrm{T}_{\text {house }}\right)=\dot{\mathrm{Q}}_{\mathrm{L}} \quad \text { which must be removed by the heat pump. } \\
\beta & =\dot{\mathrm{Q}}_{\mathrm{L}} / \dot{\mathrm{W}}=0.6 \beta_{\text {carnot }}=0.6 \mathrm{~T}_{\text {house }} /\left(\mathrm{T}_{\text {amb }}-\mathrm{T}_{\text {house }}\right)
\end{aligned}
$$

Substitute in for $\dot{\mathrm{Q}}_{\mathrm{L}}$ and multiply with $\left(\mathrm{T}_{\mathrm{amb}}-\mathrm{T}_{\text {house }}\right) \dot{\mathrm{W}}$ :

$$
0.6\left(\mathrm{~T}_{\mathrm{amb}}-\mathrm{T}_{\text {house }}\right)^{2}=0.6 \mathrm{~T}_{\text {house }} \dot{\mathrm{W}}
$$

Since $\mathrm{T}_{\text {house }}=293.15 \mathrm{~K}$ and $\dot{\mathrm{W}}=1.2 \mathrm{~kW}$ it follows

$$
\left(\mathrm{T}_{\mathrm{amb}}-\mathrm{T}_{\text {house }}\right)^{2}=\mathrm{T}_{\text {house }} \dot{\mathrm{W}}=293.15 \times 1.2=351.78 \mathrm{~K}^{2}
$$

Solving $\Rightarrow\left(\mathrm{T}_{\mathrm{amb}}-\mathrm{T}_{\text {house }}\right)=18.76 \Rightarrow \mathrm{~T}_{\mathrm{amb}}=\mathbf{3 1 1 . 9} \mathbf{K}=38.8^{\circ} \mathbf{C}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A house is cooled by an electric heat pump using the outside as the hightemperature reservoir. For several different summer outdoor temperatures, estimate the percent savings in electricity if the house is kept at $25^{\circ} \mathrm{C}$ instead of $20^{\circ} \mathrm{C}$. Assume that the house is gaining energy from the outside directly proportional to the temperature difference as in Eq. 7.14.

Solution:

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A Carnot heat engine, shown in Fig. P7.89, receives energy from a reservoir at $T_{\text {res }}$ through a heat exchanger where the heat transferred is proportional to the
temperature difference as $\dot{\mathrm{Q}}_{\mathrm{H}}=\mathrm{K}\left(\mathrm{T}_{\text {res }}-\mathrm{T}_{\mathrm{H}}\right)$. It rejects heat at a given low temperature $T_{L}$. To design the heat engine for maximum work output show that the high temperature, $\mathrm{T}_{\mathrm{H}}$, in the cycle should be selected as $\mathrm{T}_{\mathrm{H}}=\sqrt{\mathrm{T}_{\text {res }} \mathrm{T}_{\mathrm{L}}}$

Solution:

$$
\begin{aligned}
& \mathrm{W}=\eta_{T H} \mathrm{Q}_{H}=\frac{\mathrm{T}_{H}-\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}} \times \mathrm{K}\left(\mathrm{~T}_{\mathrm{res}}-\mathrm{T}_{\mathrm{H}}\right) ; \quad \text { maximize } \mathrm{W}\left(\mathrm{~T}_{\mathrm{H}}\right) \Rightarrow \frac{\delta \mathrm{W}}{\delta \mathrm{~T}_{H}}=0 \\
& \frac{\delta \mathrm{~W}}{\delta \mathrm{~T}_{\mathrm{H}}}=\mathrm{K}\left(\mathrm{~T}_{\mathrm{res}}-\mathrm{T}_{\mathrm{H}}\right) \mathrm{T}_{\mathrm{L}} \mathrm{~T}_{\mathrm{H}}^{-2}-\mathrm{K}\left(1-\mathrm{T}_{\mathrm{L}} / \mathrm{T}_{\mathrm{H}}\right)=0 \\
& \Rightarrow \mathbf{T}_{\mathbf{H}}=\sqrt{\mathbf{T}_{\text {res }} \mathrm{T}_{\mathbf{L}}}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Consider a Carnot cycle heat engine operating in outer space. Heat can be rejected from this engine only by thermal radiation, which is proportional to the radiator area and the fourth power of absolute temperature, $\dot{Q}_{\mathrm{rad}} \sim K A T^{4}$. Show that for a given engine work output and given $\mathrm{T}_{\mathrm{H}}$, the radiator area will be minimum when the ratio $\mathrm{T}_{\mathrm{L}} / \mathrm{T}_{\mathrm{H}}=3 / 4$.

Solution:

$$
\begin{aligned}
& \dot{\mathrm{W}}_{\mathrm{NET}}=\dot{\mathrm{Q}}_{\mathrm{H}}\left(\frac{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}\right)=\dot{\mathrm{Q}}_{\mathrm{L}}\left(\frac{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{L}}}\right) ; \quad \text { also } \quad \dot{\mathrm{Q}}_{\mathrm{L}}=\mathrm{KAT}_{\mathrm{L}}^{4} \\
& \frac{\dot{\mathrm{~W}}_{\mathrm{NET}}}{\mathrm{KT}_{\mathrm{H}}^{4}}=\frac{\mathrm{AT}_{\mathrm{L}}^{4}}{\mathrm{~T}_{\mathrm{H}}^{4}}\left(\frac{\mathrm{~T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{L}}}-1\right)=\mathrm{A}\left[\left(\frac{\mathrm{~T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}\right)^{3}-\left(\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}\right)^{4}\right]=\text { const }
\end{aligned}
$$

Differentiating,

$$
\begin{aligned}
& d A\left[\left(\frac{T_{L}}{T_{H}}\right)^{3}-\left(\frac{T_{L}}{T_{H}}\right)^{4}\right]+A\left[3\left(\frac{T_{L}}{T_{H}}\right)^{2}-4\left(\frac{T_{L}}{T_{H}}\right)^{3}\right] d\left(\frac{T_{L}}{T_{H}}\right)=0 \\
& \frac{d A}{d\left(T_{L} / T_{H}\right)}=-A\left[3\left(\frac{T_{L}}{T_{H}}\right)^{2}-4\left(\frac{T_{L}}{T_{H}}\right)^{3}\right] /\left[\left(\frac{T_{L}}{T_{H}}\right)^{3}-\left(\frac{T_{L}}{T_{H}}\right)^{4}\right]=0
\end{aligned}
$$

$$
\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=\frac{3}{4} \quad \text { for min. } \mathrm{A}
$$

Check that it is minimum and not maximum with the $2^{\text {nd }}$ derivative $>0$.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. On a cold $\left(-10^{\circ} \mathrm{C}\right)$ winter day a heat pump provides 20 kW to heat a house maintained at $20^{\circ} \mathrm{C}$ and it has a $\mathrm{COP}_{\mathrm{HP}}$ of 4 . How much power does the heat pump require? The next day a winter storm brings the outside to $-15^{\circ} \mathrm{C}$, assuming the same COP and the same house heat transfer coefficient for the heat loss to the outside air. How much power does the heat pump require then?

If we look at the heat loss for the house we have

$$
\dot{\mathrm{Q}}_{\mathrm{loss}}=20 \mathrm{~kW}=\mathrm{CA} \Delta \mathrm{~T} \quad \Rightarrow \quad \mathrm{CA}=\frac{20 \mathrm{~kW}}{20-(-10) \mathrm{K}}=0.667 \mathrm{~kW} / \mathrm{K}
$$

So now with the new outdoor temperature we get

$$
\begin{aligned}
& \dot{\mathrm{Q}}_{\mathrm{loss}}=\mathrm{CA} \Delta \mathrm{~T}=0.667 \mathrm{~kW} / \mathrm{K} \times[20-(-15)] \mathrm{K}=23.3 \mathrm{~kW} \\
& \dot{\mathrm{Q}}_{\mathrm{loss}}=\dot{\mathrm{Q}}_{\mathrm{H}}=\mathrm{COP} \dot{\mathrm{~W}} \Rightarrow \dot{\mathrm{~W}}=\dot{\mathrm{Q}}_{\mathrm{loss}} / \mathrm{COP}=\frac{23.3 \mathrm{~kW}}{4}=\mathbf{5 . 8 3} \mathbf{~ k W}
\end{aligned}
$$

## Ideal Gas Carnot Cycles

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Hydrogen gas is used in a Carnot cycle having an efficiency of $60 \%$ with a low temperature of 300 K . During the heat rejection the pressure changes from 90 kPa to 120 kPa . Find the high and low temperature heat transfer and the net cycle work per unit mass of hydrogen.

Solution:
As the efficiency is known, the high temperature is found as

$$
\eta=0.6=1-\frac{T_{L}}{T_{H}} \quad=>T_{H}=T_{L} /(1-0.6)=750 \mathrm{~K}
$$

Now the volume ratio needed for the heat transfer, $T_{3}=T_{4}=T_{L}$, is

$$
\mathrm{v}_{3} / \mathrm{v}_{4}=\left(\mathrm{RT}_{3} / \mathrm{P}_{3}\right) /\left(\mathrm{RT}_{4} / \mathrm{P}_{4}\right)=\mathrm{P}_{4} / \mathrm{P}_{3}=120 / 90=1.333
$$

so from Eq. 7.9 we have with $\mathrm{R}=4.1243$ from Table A. 5

$$
\mathrm{q}_{\mathrm{L}}=\mathrm{RT}_{\mathrm{L}} \ln \left(\mathrm{v}_{3} / \mathrm{v}_{4}\right)=\mathbf{3 5 5 . 9 5} \mathbf{k J} / \mathbf{k g}
$$

Using the efficiency from Eq. 7.4 then

$$
\mathrm{q}_{\mathrm{H}}=\mathrm{q}_{\mathrm{L}} /(1-0.6)=\mathbf{8 8 9 . 9} \mathbf{~ k J} / \mathbf{k g}
$$

The net work equals the net heat transfer

$$
\mathrm{w}=\mathrm{q}_{\mathrm{H}}-\mathrm{q}_{\mathrm{L}}=\mathbf{5 3 3 . 9} \mathbf{~ k J} / \mathbf{k g}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Carbon dioxide is used in an ideal gas refrigeration cycle, reverse of Fig. 7.24. Heat absorption is at 250 K and heat rejection is at 325 K where the pressure changes from 1200 kPa to 2400 kPa . Find the refrigeration COP and the specific heat transfer at the low temperature.

The analysis is the same as for the heat engine except the signs are opposite so the heat transfers move in the opposite direction.

$$
\begin{aligned}
& \beta=\dot{\mathrm{Q}}_{\mathrm{L}} / \dot{\mathrm{W}}=\beta_{\text {carnot }}=\mathrm{T}_{\mathrm{L}} /\left(\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)=\frac{250}{325-250}=3.33 \\
& \mathrm{q}_{\mathrm{H}}=\mathrm{RT}_{\mathrm{H}} \ln \left(\mathrm{v}_{2} / \mathrm{v}_{1}\right)=\mathrm{RT}_{\mathrm{H}} \ln \left(\frac{\mathrm{P}_{1}}{\mathrm{P}_{2}}\right)=0.1889 \times 325 \ln \left(\frac{2400}{1200}\right)=42.55
\end{aligned}
$$

$\mathrm{kJ} / \mathrm{kg}$

$$
\mathrm{q}_{\mathrm{L}}=\mathrm{q}_{\mathrm{H}} \mathrm{~T}_{\mathrm{L}} / \mathrm{T}_{\mathrm{H}}=42.55 \times 250 / 325=\mathbf{3 2 . 7 3} \mathbf{~ k J} / \mathbf{k g}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

An ideal gas Carnot cycle with air in a piston cylinder has a high temperature of 1200 K and a heat rejection at 400 K . During the heat addition the volume triples. Find the two specific heat transfers $(\mathrm{q})$ in the cycle and the overall cycle efficiency.

## Solution:

The P-v diagram of the cycle is shown to the right.
From the integration along the process curves done in the main text we have Eq.7.7

$$
\begin{aligned}
\mathrm{q}_{\mathrm{H}} & =\mathrm{R} \mathrm{~T}_{\mathrm{H}} \ln \left(\mathrm{v}_{2} / \mathrm{v}_{1}\right) \\
& =0.287 \times 1200 \ln (3) \\
& =\mathbf{3 7 8 . 4} \mathbf{~ k J} / \mathbf{k g}
\end{aligned}
$$

Since it is a Carnot cycle the knowledge of the temperatures gives the cycle efficiency as

$$
\eta_{\mathrm{TH}}=1-\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=1-\frac{400}{1200}=\mathbf{0 . 6 6 7}
$$

from which we can get the other heat transfer from Eq.7.4

$$
\mathrm{q}_{\mathrm{L}}=\mathrm{q}_{\mathrm{H}} \mathrm{~T}_{\mathrm{L}} / \mathrm{T}_{\mathrm{H}}=378.4400 / 1200=\mathbf{1 2 6 . 1} \mathbf{~ k J} / \mathbf{k g}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

Air in a piston/cylinder goes through a Carnot cycle with the P-v diagram shown in Fig. 7.24. The high and low temperatures are 600 K and 300 K respectively. The heat added at the high temperature is $250 \mathrm{~kJ} / \mathrm{kg}$ and the lowest pressure in the cycle is 75 kPa . Find the specific volume and pressure after heat rejection and the net work per unit mass.

Solution:

$$
\mathrm{q}_{\mathrm{H}}=250 \mathrm{~kJ} / \mathrm{kg}, \quad \mathrm{~T}_{\mathrm{H}}=600 \mathrm{~K}, \quad \mathrm{~T}_{\mathrm{L}}=300 \mathrm{~K}, \quad \mathrm{P}_{3}=75 \mathrm{kPa}
$$

The states as shown in figure 7.21

$$
1: 600 \mathrm{~K}, \quad 2: 600 \mathrm{~K}, \quad 3: 75 \mathrm{kPa}, 300 \mathrm{~K} \quad 4: 300 \mathrm{~K}
$$

Since this is a Carnot cycle and we know the temperatures the efficiency is

$$
\eta=1-\frac{T_{L}}{T_{H}}=1-\frac{300}{600}=0.5
$$

and the net work becomes

$$
\begin{aligned}
\mathrm{w}_{\mathrm{NET}} & =\eta \mathrm{q}_{\mathrm{H}}=0.5 \times 250 \\
& =\mathbf{1 2 5} \mathbf{~ k J} / \mathbf{k g}
\end{aligned}
$$

The heat rejected is

$$
\mathrm{q}_{\mathrm{L}}=\mathrm{q}_{\mathrm{H}}-\mathrm{w}_{\mathrm{NET}}=125 \mathrm{~kJ} / \mathrm{kg}
$$

After heat rejection is state 4. From equation 7.9

$$
\begin{aligned}
& 3 \rightarrow 4 \text { Eq. } 7.9: \quad \mathrm{q}_{\mathrm{L}}=\mathrm{RT}_{\mathrm{L}} \ln \left(\mathrm{v}_{3} / \mathrm{v}_{4}\right) \\
& \mathrm{v}_{3}=\mathrm{RT}_{3} / \mathrm{P}_{3}=0.287 \times 300 / 75=1.148 \mathrm{~m}^{3} / \mathrm{kg} \\
& \mathrm{v}_{4}=\mathrm{v}_{3} \exp \left(-\mathrm{q}_{\mathrm{L}} / \mathrm{RT}_{\mathrm{L}}\right)=1.148 \exp (-125 / 0.287 \times 300)=\mathbf{0 . 2 6 8 8} \mathbf{~ m}^{3} / \mathbf{k g} \\
& \mathrm{P}_{4}=\mathrm{RT}_{4} / \mathrm{v}_{4}=0.287 \times 300 / 0.2688=\mathbf{3 2 0} \mathbf{~ k P a}
\end{aligned}
$$

## Review Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

At certain locations geothermal energy in undergound water is available and used as the energy source for a power plant. Consider a supply of saturated liquid water at $150^{\circ} \mathrm{C}$. What is the maximum possible thermal efficiency of a cyclic heat engine using this source of energy with the ambient at $20^{\circ} \mathrm{C}$ ? Would it be better to locate a source of saturated vapor at $150^{\circ} \mathrm{C}$ than use the saturated liquid at $150^{\circ} \mathrm{C}$ ?

Solution:

$$
\begin{aligned}
& \mathrm{T}_{\text {MAX }}=150^{\circ} \mathrm{C}=423.2 \mathrm{~K}=\mathrm{T}_{\mathrm{H}} ; \quad \mathrm{T}_{\text {Min }}=20^{\circ} \mathrm{C}=293.2 \mathrm{~K}=\mathrm{T}_{\mathrm{L}} \\
& \eta_{\text {TH MAX }}=\frac{\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}}=\frac{130}{423.2}=\mathbf{0 . 3 0 7}
\end{aligned}
$$

Yes. Saturated vapor source at $150^{\circ} \mathrm{C}$ would remain at $150^{\circ} \mathrm{C}$ as it condenses to liquid, providing a large energy supply at that temperature.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A rigid insulated container has two rooms separated by a membrane. Room A contains 1 kg air at $200^{\circ} \mathrm{C}$ and room B has 1.5 kg air at $20^{\circ} \mathrm{C}$, both rooms at 100 kPa . Consider two different cases

1) Heat transfer between $A$ and $B$ creates a final uniform $T$.
2) The membrane breaks and the air comes to a uniform state.

For both cases find the final temperature. Are the two processes reversible and different? Explain.
Solution:
C.V. Total A+B

1) Energy Eq.: $\quad U_{2}-U_{1}={ }_{1} Q_{2}-{ }_{1} W_{2}=0-0=0$

$$
\begin{array}{r}
\mathrm{U}_{2}-\mathrm{U}_{1}=0=\mathrm{m}_{\mathrm{A}}\left(\mathrm{U}_{2}-\mathrm{U}_{1}\right)_{\mathrm{A}}+\mathrm{m}_{\mathrm{B}}\left(\mathrm{U}_{2}-\mathrm{U}_{1}\right)_{\mathrm{B}} \\
\cong \mathrm{~m}_{\mathrm{A}} \mathbf{C}_{\mathbf{V}}\left(\mathrm{T}_{2}-\mathrm{T}_{\mathrm{A} 1}\right)+\mathrm{m}_{\mathrm{B}} \mathbf{C}_{\mathbf{V}}\left(\mathrm{T}_{2}-\mathrm{T}_{\mathrm{B} 1}\right) \\
\Rightarrow \mathrm{T}_{2}=\frac{\mathrm{m}_{\mathrm{A}}}{\mathrm{~m}_{\mathrm{A}}+\mathrm{m}_{\mathrm{B}}} \mathrm{~T}_{\mathrm{A} 1}+\frac{\mathrm{m}_{\mathrm{B}}}{\mathrm{~m}_{\mathrm{A}}+\mathrm{m}_{\mathrm{B}}} \mathrm{~T}_{\mathrm{B} 1}=\frac{1}{2.5} \times 200+\frac{1.5}{2.5} \times 20 \\
=\mathbf{9 2}{ }^{\mathbf{0}} \mathbf{C} \\
\mathrm{P}_{\mathrm{A} 2}=\mathrm{P}_{\mathrm{A} 1} \times \mathrm{T}_{2} / \mathrm{T}_{\mathrm{A} 1}=100 \times(273+92) / 473=77.2 \mathrm{kPa} \\
\mathrm{P}_{\mathrm{B} 2}=\mathrm{P}_{\mathrm{B} 1} \times \mathrm{T}_{2} / \mathrm{T}_{\mathrm{B} 1}=100 \times(273+92) / 293=124.6 \mathrm{kPa}
\end{array}
$$

2) Same energy eq. Since ideal gas $u(T)$ same $\mathbf{T}_{2}=\mathbf{9 2}^{\mathbf{}} \mathbf{C}$, but now also same $P_{2}$

$$
\begin{aligned}
\mathrm{P}_{2} & =\mathrm{mRT}_{2} / \mathrm{V}_{1} ; \quad \mathrm{V}_{1}=\mathrm{V}_{\mathrm{A}}+\mathrm{V}_{\mathrm{B}} \\
\mathrm{~V}_{1} & =\mathrm{m}_{\mathrm{A} 1} \mathrm{RT}_{\mathrm{A} 1} / \mathrm{P}_{1}+\mathrm{m}_{\mathrm{B} 1} \mathrm{RT}_{\mathrm{B} 1} / \mathrm{P}_{1} \\
\mathrm{P}_{2} & =\left(\mathrm{m}_{2} \mathrm{RT}_{2} /\left(\mathrm{m}_{\mathrm{A} 1} \mathrm{RT}_{\mathrm{A} 1} / \mathrm{P}_{1}+\mathrm{m}_{\mathrm{B} 1} \mathrm{RT}_{\mathrm{B} 1} / \mathrm{P}_{1}\right)\right) \\
& =\mathrm{P}_{1}\left(\mathrm{~m}_{2} \mathrm{~T}_{2} /\left(\mathrm{m}_{\mathrm{A} 1} \mathrm{~T}_{\mathrm{A} 1}+\mathrm{m}_{\mathrm{B} 1} \mathrm{~T}_{\mathrm{B} 1}\right)\right)=100 \frac{2.5(273+92)}{1 \times 473+1.5 \times 293} \\
& =100 \mathrm{kPa}
\end{aligned}
$$

Both cases irreversible 1) Q over a finite $\Delta \mathrm{T}$ and in 2) mixing of 2 different states (internal u redistribution)
(Case 2) is more irreversible as the final state in 1 could drive a turbine between the two different pressures until equal.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.98

Consider the combination of the two heat engines as in Fig. P7.4. How should the intermediate temperature be selected so the two heat engines have the same efficiency assuming Carnot cycle heat engines.

Heat engine 1: $\quad \eta_{T H ~}=1-\frac{T_{M}}{T_{H}}$
Heat engine 2: $\quad \eta_{T H 2}=1-\frac{T_{L}}{T_{M}}$

$$
\begin{aligned}
\eta_{\mathrm{TH} 1}=\eta_{\mathrm{TH} 2} & \Rightarrow 1-\frac{\mathrm{T}_{\mathrm{M}}}{\mathrm{~T}_{\mathrm{H}}}=1-\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{M}}} \Rightarrow \frac{\mathrm{~T}_{\mathrm{M}}}{\mathrm{~T}_{\mathrm{H}}}=\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{M}}} \\
& \Rightarrow \mathrm{~T}_{\mathrm{M}}=\sqrt{\mathrm{T}_{\mathrm{L}} \mathrm{~T}_{\mathrm{H}}}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A house should be heated by a heat pump, $\beta^{\prime}=2.2$, and maintained at $20^{\circ} \mathrm{C}$ at all times. It is estimated that it looses 0.8 kW per degree the ambient is lower than the inside. Assume an outside temperature of $-10^{\circ} \mathrm{C}$ and find the needed power to drive the heat pump?

Solution: Ambient $\mathrm{T}_{\mathrm{L}}=-10^{\circ} \mathrm{C}$
Heat pump : $\quad \beta^{\prime}=\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{W}}$
House : $\quad \dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{Q}}_{\text {leak }}=0.8\left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right)$

$$
\begin{aligned}
\dot{\mathrm{W}} & =\dot{\mathrm{Q}}_{\mathrm{H}} / \beta^{\prime}=\dot{\mathrm{Q}}_{\text {leak }} / \beta^{\prime}=0.8\left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right) / \beta^{\prime} \\
& =0.8[20-(-10)] / 2.2=\mathbf{1 0 . 9 1} \mathbf{k W}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.100

Consider a combination of a gas turbine power plant and a steam power plant as shown in Fig. P7.4. The gas turbine operates at higher temperatures (thus called a topping cycle) than the steam power plant (then called a bottom cycle). Assume both cycles have a thermal efficiency of $32 \%$. What is the efficiency of the overall combination assuming $\mathrm{Q}_{\mathrm{L}}$ in the gas turbine equals $\mathrm{Q}_{\mathrm{H}}$ to the steam power plant?

Let the gas turbine be heat engine number 1 and the steam power plant the heat engine number 2. Then the overall efficiency

$$
\eta_{\mathrm{TH}}=\dot{\mathrm{W}}_{\mathrm{net}} / \dot{\mathrm{Q}}_{\mathrm{H}}=\left(\dot{\mathrm{W}}_{1}+\dot{\mathrm{W}}_{2}\right) / \dot{\mathrm{Q}}_{\mathrm{H}}=\eta_{1}+\dot{\mathrm{W}}_{2} / \dot{\mathrm{Q}}_{\mathrm{H}}
$$

For the second heat engine and the energy Eq. for the first heat engine

$$
\dot{\mathrm{W}}_{2}=\eta_{2} \dot{\mathrm{Q}}_{\mathrm{M}}=\eta_{2}\left(1-\eta_{1}\right) \dot{\mathrm{Q}}_{\mathrm{H}}
$$

so the final result is

$$
\eta_{\mathrm{TH}}=\eta_{1}+\eta_{2}\left(1-\eta_{1}\right)=0.32+0.32(1-0.32)=\mathbf{0 . 5 3 8}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.101

We wish to produce refrigeration at $-30^{\circ} \mathrm{C}$. A reservoir, shown in Fig. P7.101, is available at $200^{\circ} \mathrm{C}$ and the ambient temperature is $30^{\circ} \mathrm{C}$. Thus, work can be done by a cyclic heat engine operating between the $200^{\circ} \mathrm{C}$ reservoir and the ambient. This work is used to drive the refrigerator. Determine the ratio of the heat transferred from the $200^{\circ} \mathrm{C}$ reservoir to the heat transferred from the $-30^{\circ} \mathrm{C}$ reservoir, assuming all processes are reversible.

Solution:
Equate the work from the heat engine to the refrigerator.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.102

A 4 L jug of milk at $25^{\circ} \mathrm{C}$ is placed in your refrigerator where it is cooled down to $5^{\circ} \mathrm{C}$. The high temperature in the Carnot refrigeration cycle is $45^{\circ} \mathrm{C}$ and the properties of milk are the same as for liquid water. Find the amount of energy that must be removed from the milk and the additional work needed to drive the refrigerator.

## Solution:

C. $V$ milk + out to the $5^{\circ} \mathrm{C}$ refrigerator space

Energy Eq.: $\quad \mathrm{m}\left(\mathrm{u}_{2}-\mathrm{u}_{1}\right)={ }_{1} \mathrm{Q}_{2}-{ }_{1} \mathrm{~W}_{2}$
Process : $\mathrm{P}=\mathrm{constant}=1 \mathrm{~atm} \quad \Rightarrow \quad{ }_{1} \mathrm{~W}_{2}=\operatorname{Pm}\left(\mathrm{v}_{2}-\mathrm{v}_{1}\right)$
State 1: Table B.1.1, $\mathrm{v}_{1} \cong \mathrm{v}_{\mathrm{f}}=0.001003 \mathrm{~m}^{3} / \mathrm{kg}, \quad \mathrm{h}_{1} \cong \mathrm{~h}_{\mathrm{f}}=104.87 \mathrm{~kJ} / \mathrm{kg}$

$$
\mathrm{m}_{2}=\mathrm{m}_{1}=\mathrm{V}_{1} / \mathrm{v}_{1}=0.004 / 0.001003=3.988 \mathrm{~kg}
$$

State 2: Table B.1.1, $\quad \mathrm{h}_{2} \cong \mathrm{~h}_{\mathrm{f}}=20.98 \mathrm{~kJ} / \mathrm{kg}$

$$
\begin{aligned}
& { }_{1} \mathrm{Q}_{2}=\mathrm{m}\left(\mathrm{u}_{2}-\mathrm{u}_{1}\right)+{ }_{1} \mathrm{~W}_{2}=\mathrm{m}\left(\mathrm{u}_{2}-\mathrm{u}_{1}\right)+\operatorname{Pm}\left(\mathrm{v}_{2}-\mathrm{v}_{1}\right)=\mathrm{m}\left(\mathrm{~h}_{2}-\mathrm{h}_{1}\right) \\
& { }_{1} \mathrm{Q}_{2}=3.998(20.98-104.87)=-3.988 \times 83.89=-\mathbf{3 3 4 . 5 5} \mathbf{k J}
\end{aligned}
$$

C.V. Refrigeration cycle $T_{L}=5{ }^{\circ} \mathrm{C} ; \mathrm{T}_{\mathrm{H}}=45^{\circ} \mathrm{C}$, assume Carnot

$$
\text { Ideal : } \begin{aligned}
\beta & =\mathrm{Q}_{\mathrm{L}} / \mathrm{W}=\mathrm{Q}_{\mathrm{L}} /\left(\mathrm{Q}_{\mathrm{H}}-\mathrm{Q}_{\mathrm{L}}\right)=\mathrm{T}_{\mathrm{L}} /\left(\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}\right) \\
& =278.15 / 40=\mathbf{6 . 9 5 4}
\end{aligned}
$$

$$
\mathrm{W}=\mathrm{Q}_{\mathrm{L}} / \beta=334.55 / 6.954=\mathbf{4 8 . 1} \mathbf{k J}
$$

Remark: If you calculate the work term ${ }_{1} \mathrm{~W}_{2}$ you will find that it is very small, the volume does not change (liquid). The heat transfer could then have been done as $m\left(u_{2}-u_{1}\right)$ without any change in the numbers.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.103

An air-conditioner with a power input of 1.2 kW is working as a refrigerator ( $\beta=$ 3 ) or as a heat pump $\left(\beta^{\prime}=4\right)$. It maintains an office at $20^{\circ} \mathrm{C}$ year round which exchanges 0.5 kW per degree temperature difference with the atmosphere. Find the maximum and minimum outside temperature for which this unit is sufficient.

Solution:
Analyze the unit in heat pump mode
Replacement heat transfer equals the loss: $\dot{\mathrm{Q}}=0.5\left(\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{amb}}\right)$

$$
\begin{aligned}
& \dot{\mathrm{W}}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\beta^{\prime}}=0.5 \frac{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{amb}}}{4} \\
& \mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{amb}}=4 \frac{\dot{\mathrm{~W}}}{0.5}=9.6 \mathrm{~K}
\end{aligned}
$$

Heat pump mode: Minumum $\mathrm{T}_{\mathrm{amb}}=20-9.6=\mathbf{1 0 . 4}{ }^{\circ} \mathbf{C}$
The unit as a refrigerator must cool with rate: $\dot{\mathrm{Q}}=0.5\left(\mathrm{~T}_{\mathrm{amb}}-\mathrm{T}_{\text {house }}\right)$

$$
\begin{gathered}
\dot{\mathrm{W}}=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\beta}=0.5\left(\mathrm{~T}_{\mathrm{amb}}-\mathrm{T}_{\text {house }}\right) / 3 \\
\mathrm{~T}_{\mathrm{amb}}-\mathrm{T}_{\text {house }}=3 \frac{\dot{\mathrm{~W}}}{0.5}=7.2 \mathrm{~K} \\
\text { Refrigerator mode: Maximum } \mathrm{T}_{\mathrm{amb}}=20+7.2=\mathbf{2 7 . 2}{ }^{\circ} \mathbf{C}
\end{gathered}
$$

7.104

Make some assumption about the heat transfer rates to solve problem 7.62 when the outdoor temperature is $-20^{\circ} \mathrm{C}$. Hint: look at the heat transfer given by Eq.7.14.

Solution:

Minimum power if we assume a Carnot cycle

We assume the heat transfer coefficient stays the same

$$
\begin{aligned}
& \dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{Q}}_{\text {leak }}=25 \mathrm{~kW}=\mathrm{CA} \Delta \mathrm{~T}=\mathrm{CA}[20-(-10)] \Rightarrow \mathrm{CA}=\frac{5}{6} \mathrm{~kW} / \mathrm{K} \\
& \dot{\mathrm{Q}}_{\text {leak new }}=\mathrm{CA} \Delta \mathrm{~T}=\frac{5}{6}[20-(-20)]=33.33 \mathrm{~kW} \\
& \beta^{\prime}=\frac{\dot{\mathrm{Q}}_{\mathrm{H}}}{\dot{\mathrm{~W}}_{\mathrm{IN}}}=\frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{293.15}{40}=7.32875 \Rightarrow \dot{\mathrm{~W}}_{\mathrm{IN}}=\frac{33.333}{7.32875}=4.55 \mathrm{~kW}
\end{aligned}
$$

Comment. Leak heat transfer increases and COP is lower when T outside drops.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Air in a rigid $1 \mathrm{~m}^{3}$ box is at $300 \mathrm{~K}, 200 \mathrm{kPa}$. It is heated to 600 K by heat transfer from a reversible heat pump that receives energy from the ambient at 300 K besides the work input. Use constant specific heat at 300 K . Since the coefficient of performance changes write $d Q=m_{\text {air }} C_{v} d T$ and find $d W$. Integrate $d W$ with temperature to find the required heat pump work.

Solution:

$$
\begin{aligned}
& \text { COP: } \quad \beta^{\prime}=\frac{\mathrm{Q}_{\mathrm{H}}}{\mathrm{~W}}=\frac{\mathrm{Q}_{\mathrm{H}}}{\mathrm{Q}_{\mathrm{H}}-\mathrm{Q}_{\mathrm{L}}} \cong \frac{\mathrm{~T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}} \\
& \begin{aligned}
\mathrm{m}_{\text {air }} & =\mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{RT}_{1}=200 \times 1 / 0.287 \times 300=2.322 \mathrm{~kg} \\
\mathrm{dQ}_{\mathrm{H}} & =\mathrm{m}_{\text {air }} \mathrm{C}_{\mathrm{v}} \mathrm{dT}_{\mathrm{H}}=\beta^{\prime} \mathrm{dW} \cong \frac{\mathrm{~T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}} \mathrm{dW} \\
& \Rightarrow \quad \mathrm{dW}=\mathrm{m}_{\text {air }} \mathrm{C}_{\mathrm{v}}\left[\frac{\mathrm{~T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}\right] \mathrm{dT}_{\mathrm{H}} \\
{ }_{1} \mathrm{~W}_{2} & =\int \mathrm{m}_{\text {air }} \mathrm{C}_{\mathrm{V}}\left(1-\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}}\right) \mathrm{dT}=\mathrm{m}_{\text {air }} \mathrm{C}_{\mathrm{v}} \int\left(1-\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}}\right) \mathrm{dT} \\
& =\mathrm{m}_{\text {air }} \mathrm{C}_{\mathrm{v}}\left[\mathrm{~T}_{2}-\mathrm{T}_{1}-\mathrm{T}_{\mathrm{L}} \ln \frac{\mathrm{~T}_{2}}{\mathrm{~T}_{1}}\right] \\
& =2.322 \times 0.717\left[600-300-300 \ln \frac{600}{300}\right]=\mathbf{1 5 3 . 1} \mathbf{k J}
\end{aligned}
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A combination of a heat engine driving a heat pump (see Fig. P7.106) takes waste energy at $50^{\circ} \mathrm{C}$ as a source $\mathrm{Q}_{\mathrm{w} 1}$ to the heat engine rejecting heat at $30^{\circ} \mathrm{C}$. The remainder $\mathrm{Q}_{\mathrm{w} 2}$ goes into the heat pump that delivers a $\mathrm{Q}_{\mathrm{H}}$ at $150^{\circ} \mathrm{C}$. If the total waste energy is 5 MW find the rate of energy delivered at the high temperature.

Solution:

Waste supply: $\quad \dot{\mathrm{Q}}_{\mathrm{w} 1}+\dot{\mathrm{Q}}_{\mathrm{w} 2}=5 \mathrm{MW}$
Heat Engine:

$$
\dot{\mathrm{W}}=\eta \dot{\mathrm{Q}}_{\mathrm{w} 1}=\left(1-\mathrm{T}_{\mathrm{L} 1} / \mathrm{T}_{\mathrm{H} 1}\right) \dot{\mathrm{Q}}_{\mathrm{w} 1}
$$

Heat pump:

$$
\begin{aligned}
\dot{\mathrm{W}} & =\dot{\mathrm{Q}}_{\mathrm{H}} / \beta_{\mathrm{HP}}=\dot{\mathrm{Q}}_{\mathrm{W} 2} / \beta^{\prime} \\
& =\dot{\mathrm{Q}}_{\mathrm{W} 2} /\left[\mathrm{T}_{\mathrm{H} 1} /\left(\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{H} 1}\right)\right]
\end{aligned}
$$

Equate the two work terms:

$$
\left(1-\mathrm{T}_{\mathrm{L} 1} / \mathrm{T}_{\mathrm{H} 1}\right) \dot{\mathrm{Q}}_{\mathrm{w} 1}=\dot{\mathrm{Q}}_{\mathrm{W} 2} \times\left(\mathrm{T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{H} 1}\right) / \mathrm{T}_{\mathrm{H} 1}
$$

Substitute $\quad \dot{\mathrm{Q}}_{\mathrm{w} 1}=5 \mathrm{MW}-\dot{\mathrm{Q}}_{\mathrm{w} 2}$

$$
\begin{aligned}
& \quad(1-303.15 / 323.15)\left(5-\dot{\mathrm{Q}}_{\mathrm{w} 2}\right)=\dot{\mathrm{Q}}_{\mathrm{w} 2} \times(150-50) / 323.15 \\
& 20\left(5-\dot{\mathrm{Q}}_{\mathrm{W} 2}\right)=\dot{\mathrm{Q}}_{\mathrm{w} 2} \times 100 \quad \Rightarrow \quad \dot{\mathrm{Q}}_{\mathrm{w} 2}=0.8333 \mathrm{MW} \\
& \dot{\mathrm{Q}}_{\mathrm{w} 1}=5-0.8333=4.1667 \mathrm{MW} \\
& \dot{\mathrm{~W}}=\eta \dot{\mathrm{Q}}_{\mathrm{w} 1}=0.06189 \times 4.1667=0.258 \mathrm{MW} \\
& \dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{Q}}_{\mathrm{w} 2}+\dot{\mathrm{W}}=\mathbf{1 . 0 9} \mathbf{~ M W}
\end{aligned}
$$

(For the heat pump $\beta^{\prime}=423.15 / 100=4.23$ )

A heat pump heats a house in the winter and then reverses to cool it in the summer. The interior temperature should be $20^{\circ} \mathrm{C}$ in the winter and $25^{\circ} \mathrm{C}$ in the summer. Heat transfer through the walls and ceilings is estimated to be 2400 kJ per hour per degree temperature difference between the inside and outside.
a. If the winter outside temperature is $0^{\circ} \mathrm{C}$, what is the minimum power required to drive the heat pump?
b.For the same power as in part (a), what is the maximum outside summer temperature for which the house can be maintained at $25^{\circ} \mathrm{C}$ ?
Solution:
a) Winter:

House is $\mathrm{T}_{\mathrm{H}}$ and ambient is at $T_{L}$

$$
\begin{aligned}
\mathrm{T}_{\mathrm{H}}=20^{\circ} \mathrm{C} & =293.2 \mathrm{~K}, \mathrm{~T}_{\mathrm{L}}=0^{\circ} \mathrm{C}=273.2 \mathrm{~K} \text { and } \dot{\mathrm{Q}}_{\mathrm{H}}=2400(20-0) \mathrm{kJ} / \mathrm{h} \\
\beta^{\prime} & =\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{W}}_{\mathrm{IN}}=2400(20-0) / \dot{\mathrm{W}}_{\mathrm{IN}}=\frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{293.2}{20} \\
\Rightarrow & \dot{\mathrm{~W}}_{\mathrm{IN}}=3275 \mathrm{~kJ} / \mathrm{h}=\mathbf{0 . 9 1} \mathbf{~ k W} \quad \text { (For Carnot cycle) }
\end{aligned}
$$

b)

Summer:

$$
\mathrm{T}_{\mathrm{L}}=\mathrm{T}_{\text {house }}
$$

$$
\mathrm{T}_{\mathrm{H}}=\mathrm{T}_{\mathrm{amb}}
$$

$$
\begin{gathered}
\mathrm{T}_{\mathrm{L}}=25^{\circ} \mathrm{C}=298.2 \mathrm{~K}, \quad \dot{\mathrm{~W}}_{\mathrm{IN}}=3275 \mathrm{~kJ} / \mathrm{h} \text { and } \dot{\mathrm{Q}}_{\mathrm{L}}=2400\left(\mathrm{~T}_{\mathrm{H}}-298.2\right) \mathrm{kJ} / \mathrm{h} \\
\beta=\frac{\dot{\mathrm{Q}}_{\mathrm{L}}}{\dot{\mathrm{~W}}_{\mathrm{IN}}}=\frac{2400\left(\mathrm{~T}_{\mathrm{H}}-298.2\right)}{3275}=\frac{\mathrm{T}_{\mathrm{L}}}{\mathrm{~T}_{\mathrm{H}}-\mathrm{T}_{\mathrm{L}}}=\frac{298.2}{\mathrm{~T}_{\mathrm{H}}-298.2}
\end{gathered}
$$

$$
\text { or, }\left(\mathrm{T}_{\mathrm{H}}-298.2\right)^{2}=\frac{298.2 \times 3275}{2400}=406.92
$$

$$
\mathrm{T}_{\mathrm{H}}=318.4 \mathrm{~K}=\mathbf{4 5 . 2 ^ { \circ } \mathrm { C }}
$$

### 7.108

A remote location without electricity operates a refrigerator with a bottle of propane feeding a burner to create hot gases. Sketch the setup in terms of cyclic devices and give a relation for the ratio of $\dot{\mathrm{Q}}_{\mathrm{L}}$ in the refrigerator to $\dot{\mathrm{Q}}_{\text {fuel }}$ in the burner in terms of the various reservoir temperatures.
C.V.: Heat Eng.: $\dot{\mathrm{W}}_{\mathrm{HE}}=\eta_{\mathrm{HE}} \dot{\mathrm{Q}}_{\text {fuel }}$
C.V.: Refrigerator: $\dot{\mathrm{Q}}_{\mathrm{L} 2}=\beta \dot{\mathrm{W}}_{\mathrm{HE}}=\beta \eta_{\mathrm{HE}} \dot{\mathrm{Q}}_{\mathrm{fuel}}$

The ratio becomes

$$
\begin{aligned}
\dot{\mathrm{Q}}_{\mathrm{L} 2} / \dot{\mathrm{Q}}_{\text {fuel }} & =\beta \eta_{\mathrm{HE}} \\
& =\frac{\mathrm{T}_{\mathrm{L} 2}}{\mathrm{~T}_{\mathrm{H} 2}-\mathrm{T}_{\mathrm{L} 2}}\left(1-\frac{\mathrm{T}_{\mathrm{L} 1}}{\mathrm{~T}_{\mathrm{H} 1}}\right) \quad \text { If Carnot devices }
\end{aligned}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

A furnace, shown in Fig. P7.109, can deliver heat, $Q_{H 1}$ at $T_{H 1}$ and it is proposed to use this to drive a heat engine with a rejection at $T_{\text {atm }}$ instead of direct room heating. The heat engine drives a heat pump that delivers $Q_{H 2}$ at $T_{\text {room }}$ using the atmosphere as the cold reservoir. Find the ratio $Q_{H 2} / Q_{H 1}$ as a function of the temperatures. Is this a better set-up than direct room heating from the furnace?

Solution:
C.V.: Heat Eng.: $\dot{\mathrm{W}}_{\mathrm{HE}}=\eta \dot{\mathrm{Q}}_{\mathrm{H} 1} \quad$ where $\eta=1-\mathrm{T}_{\mathrm{atm}} / \mathrm{T}_{\mathrm{H} 1}$
C.V.: Heat Pump: $\dot{\mathrm{W}}_{\mathrm{HP}}=\dot{\mathrm{Q}}_{\mathrm{H} 2} / \beta^{\prime}$ where $\beta^{\prime}=\mathrm{T}_{\mathrm{rm}} /\left(\mathrm{T}_{\mathrm{rm}}-\mathrm{T}_{\mathrm{atm}}\right)$

Work from heat engine goes into heat pump so we have

$$
\dot{\mathrm{Q}}_{\mathrm{H} 2}=\beta^{\prime} \dot{\mathrm{W}}_{\mathrm{HP}}=\beta^{\prime} \eta \dot{\mathrm{Q}}_{\mathrm{H} 1}
$$

and we may substitute T's for $\beta^{\prime}, \eta$. If furnace is used directly $\dot{\mathrm{Q}}_{\mathrm{H} 2}=\dot{\mathrm{Q}}_{\mathrm{H} 1}$, so if $\beta^{\prime} \eta>1$ this proposed setup is better. Is it? For $T_{H 1}>T_{a t m}$ formula shows that it is good for Carnot cycles. In actual devices it depends wether $\beta^{\prime} \eta>1$ is obtained.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.110

Consider the rock bed thermal storage in Problem 7.65. Use the specific heat so you can write $\mathrm{dQ}_{\mathrm{H}}$ in terms of $\mathrm{dT}_{\text {rock }}$ and find the expression for dW out of the heat engine. Integrate this expression over temperature and find the total heat engine work output.

Solution:

The rock provides the heat $\mathrm{Q}_{\mathrm{H}}$

$$
\begin{gathered}
\mathrm{dQ}_{\mathrm{H}}=-\mathrm{dU}_{\text {rock }}=-\mathrm{mC} \mathrm{dT} \text { rock } \\
\mathrm{dW}=\eta \mathrm{dQ}_{\mathrm{H}}=-\left(1-\mathrm{T}_{\mathrm{o}} / \mathrm{T}_{\text {rock }}\right) \mathrm{mC} \mathrm{dT}_{\text {rock }} \\
\mathrm{m}=\rho \mathrm{V}=2750 \times 2=5500 \mathrm{~kg} \\
{ }_{1} \mathrm{~W}_{2}=\int-\left(1-\mathrm{T}_{\mathrm{o}} / \mathrm{T}_{\text {rock }}\right) \mathrm{mC} \mathrm{dT}_{\text {rock }}=-\mathrm{mC}\left[\mathrm{~T}_{2}-\mathrm{T}_{1}-\mathrm{T}_{\mathrm{o}} \ln \frac{\mathrm{~T}_{2}}{\mathrm{~T}_{1}}\right] \\
=-5500 \times 0.89\left[290-400-290 \ln \frac{290}{400}\right]=\mathbf{8 1 9 4 5} \mathbf{~ k J}
\end{gathered}
$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.

### 7.111

On a cold $\left(-10^{\circ} \mathrm{C}\right)$ winter day a heat pump provides 20 kW to heat a house maintained at $20^{\circ} \mathrm{C}$ and it has a $\mathrm{COP}_{\mathrm{HP}}$ of 4 using the maximum power available. The next day a winter storm brings the outside to $-15^{\circ} \mathrm{C}$, assuming the same COP and the house heat loss is to the outside air. How cold is the house then?

If we look at the heat loss for the house we have

$$
\begin{aligned}
& \dot{\mathrm{Q}}_{\text {loss }}=20 \mathrm{~kW}=\mathrm{CA} \Delta \mathrm{~T} \quad \Rightarrow \quad \mathrm{CA}=\frac{20 \mathrm{~kW}}{20-(-10) \mathrm{K}}=0.667 \mathrm{~kW} / \mathrm{K} \\
& \dot{\mathrm{Q}}_{\text {loss }}=\dot{\mathrm{Q}}_{\mathrm{H}}=\mathrm{COP} \dot{\mathrm{~W}} \Rightarrow \dot{\mathrm{~W}}=\dot{\mathrm{Q}}_{\text {loss }} / \mathrm{COP}=\frac{20 \mathrm{~kW}}{4}=5 \mathrm{~kW}
\end{aligned}
$$

With the same COP and the same power input we can get the same $\dot{\mathrm{Q}}_{\mathrm{H}}=20 \mathrm{~kW}$.

$$
\begin{aligned}
& \dot{\mathrm{Q}}_{\text {loss }}=\mathrm{CA} \Delta \mathrm{~T}=0.667 \mathrm{~kW} / \mathrm{K} \times[\mathrm{T}-(-15)] \mathrm{K}=20 \mathrm{~kW} \\
& \mathrm{~T}=20 \mathrm{~kW} / 0.667(\mathrm{~kW} / \mathrm{K})-15^{\circ} \mathrm{C}=(30-15)^{\circ} \mathrm{C}=\mathbf{1 5}^{\mathbf{0}} \mathbf{C}
\end{aligned}
$$

Remark: Since $\dot{\mathrm{Q}}_{\mathrm{H}}=\dot{\mathrm{Q}}_{\text {loss }}=\mathrm{CA} \Delta \mathrm{T}$ is the same the $\Delta \mathrm{T}$ becomes the same so the house can be kept at $30^{\circ} \mathrm{C}$ above the ambient. In the real system the COP drops as the outdoor T drops unless the outside heat exchanger is buried under ground with a constant temperature independent upon the weather.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
7.112

A Carnot heat engine operating between a high $\mathrm{T}_{\mathrm{H}}$ and low $\mathrm{T}_{\mathrm{L}}$ energy reservoirs has an efficiency given by the temperatures. Compare this to two combined heat engines one operating between $T_{H}$ and an intermediate temperature $T_{M}$ giving out work $\mathrm{W}_{\mathrm{A}}$ and the other operating between $\mathrm{T}_{\mathrm{M}}$ and $\mathrm{T}_{\mathrm{L}}$ giving out $\mathrm{W}_{\mathrm{B}}$. The combination must have the same efficiency as the single heat engine so the heat transfer ratio $\mathrm{Q}_{\mathrm{H}} / \mathrm{Q}_{\mathrm{L}}=\psi\left(\mathrm{T}_{\mathrm{H}}, \mathrm{T}_{\mathrm{L}}\right)=\left[\mathrm{Q}_{\mathrm{H}} / \mathrm{Q}_{\mathrm{M}}\right]\left[\mathrm{Q}_{\mathrm{M}} / \mathrm{Q}_{\mathrm{L}}\right]$. The last two heat transfer ratios can be expressed by the same function $\psi()$ involving also the temperature $\mathrm{T}_{\mathrm{M}}$. Use this to show a condition the function $\psi()$ must satisfy.

The overall heat engine is a Carnot heat engine so

$$
\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{Q}}_{\mathrm{L}}=\frac{\mathrm{T}_{\mathrm{H}}}{\mathrm{~T}_{\mathrm{L}}}=\psi\left(\mathrm{T}_{\mathrm{H}}, \mathrm{~T}_{\mathrm{L}}\right)
$$

The individual heat engines

$$
\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{Q}}_{\mathrm{M}}=\psi\left(\mathrm{T}_{\mathrm{H}}, \mathrm{~T}_{\mathrm{M}}\right) \quad \text { and } \quad \dot{\mathrm{Q}}_{\mathrm{M}} / \dot{\mathrm{Q}}_{\mathrm{L}}=\psi\left(\mathrm{T}_{\mathrm{M}}, \mathrm{~T}_{\mathrm{L}}\right)
$$

Since an identity is

$$
\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{Q}}_{\mathrm{L}}=\left[\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{Q}}_{\mathrm{M}}\right]\left[\dot{\mathrm{Q}}_{\mathrm{M}} / \dot{\mathrm{Q}}_{\mathrm{L}}\right]=\psi\left(\mathrm{T}_{\mathrm{H}}, \mathrm{~T}_{\mathrm{L}}\right)
$$

it follows that we have

$$
\psi\left(\mathrm{T}_{\mathrm{H}}, \mathrm{~T}_{\mathrm{L}}\right)=\psi\left(\mathrm{T}_{\mathrm{H}}, \mathrm{~T}_{\mathrm{M}}\right) \times \psi\left(\mathrm{T}_{\mathrm{M}}, \mathrm{~T}_{\mathrm{L}}\right)
$$

Notice here that the product of the two functions must cancel the intermediate temperature $\mathrm{T}_{\mathrm{M}}$, this shows a condition the function $\psi()$ must satisfy. The Kelvin and Rankine temperature scales are determined by the choice of the function

$$
\psi\left(\mathrm{T}_{\mathrm{H}}, \mathrm{~T}_{\mathrm{L}}\right)=\mathrm{T}_{\mathrm{H}} / \mathrm{T}_{\mathrm{L}}=\dot{\mathrm{Q}}_{\mathrm{H}} / \dot{\mathrm{Q}}_{\mathrm{L}}
$$

satisfying the above restriction.

### 7.113

A $10-\mathrm{m}^{3}$ tank of air at $500 \mathrm{kPa}, 600 \mathrm{~K}$ acts as the high-temperature reservoir for a Carnot heat engine that rejects heat at 300 K . A temperature difference of $25^{\circ} \mathrm{C}$ between the air tank and the Carnot cycle high temperature is needed to transfer the heat. The heat engine runs until the air temperature has dropped to 400 K and then stops. Assume constant specific heat capacities for air and find how much work is given out by the heat engine.

Solution:

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.
