$\overline{T h o m a s}$ ' Calculus, 13th edition by Thomas, Weir, and Hass

## Catalogue course description

Sequences and series, multivariable functions, partial derivatives, cylindrical and spherical coordinates, multiple integrals, and integration in vector fields.

## Course learning outcomes

At the end of the course, students will be able to:

- Define the sum of a series as a limit of a sequence
- Use tests to decide about the convergence of a series
- Use series to approximate functions
- Define differentiability for functions of several variables
- Find the derivative of a function in a given direction
- Maximize or minimize a function subject to a given constraint
- Define the integral of a function of several variables
- Use Fubini's theorem to evaluate double and triple integrals
- Apply double integrals (in cartesian \& polar coordinates) to find areas \& centers of "mass"
- Apply triple integrals (in cartesian, cylindrical and spherical coordinates) to find volumes \& centers of mass
- Study substitutions in double \& triple integrals.
- Line Integrals
- Green's Theorem (if time permits)
