

CHEN 311 Introduction to Fluids Engineering

Exam 1

Tuesday 22 October 2013

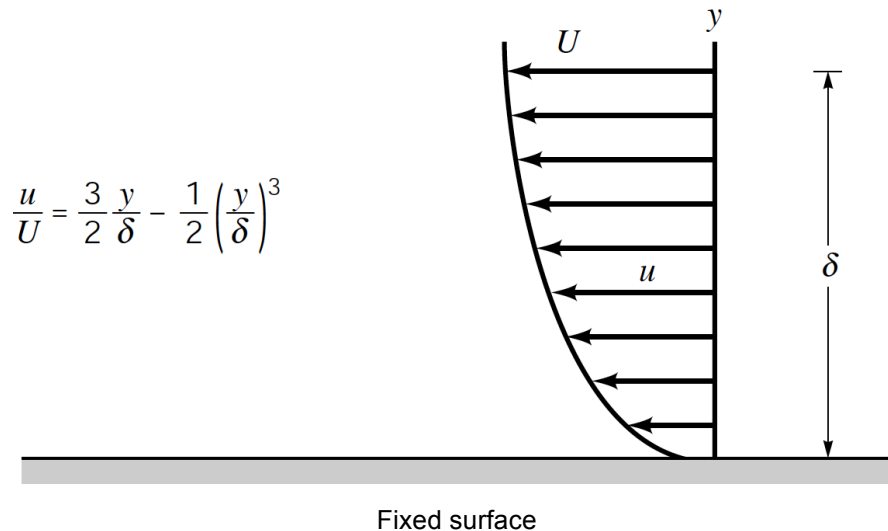

06:30 pm – 08:00 pm Bechtel ELH

Instructions:

- This exam is closed book.
- Make sure you sign your exam booklet. Failure to do so will result in a 2points deduction on your exam grade.
- The exam duration is **90 minutes**.
- Answer all questions on your exam booklet, **starting each problem on a new page**. You may annotate the figures in the question sheet, but make sure you refer to them in your answer.
- State your assumptions and show your work leading to the final answer.
- **Return this exam question sheet with your exam booklet.**

Good luck!

Problem 1: (25 points)

A *Newtonian* fluid having a specific gravity of 0.92 and a kinematic viscosity of $4 \times 10^{-4} \text{ m}^2/\text{s}$ flows past a fixed surface. Due to the no-slip condition, the velocity at the fixed surface is zero, and the velocity profile near the surface shown in the figure is described by the following equation:

$$u = U \left\{ \frac{3y}{2\delta} - \frac{1}{2} \left(\frac{y}{\delta} \right)^3 \right\}$$

where u is the velocity (m/s), U the velocity (m/s) at thickness δ (m), and y the position on the vertical axis.

Determine the magnitude of the shearing stress developed on the plate surface ($y=0$). Express your answer in terms of U and δ .

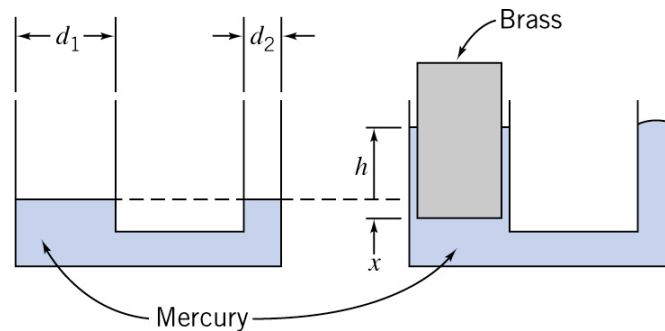

Problem 2: (25 points)

As water rises on the left side of the *rectangular* gate with *two sides in contact with water*, the gate will open automatically.

At what depth above the hinge will this occur? Neglect the mass of the gate.

Problem 3: (25 points)

A container with two circular vertical tubes of diameters $d_1 = 39.5$ mm and $d_2 = 12.7$ mm is partially filled with mercury (density 13550 kg/m³). The equilibrium level of the liquid is shown in the left diagram. A cylindrical object made from solid brass (density 8550 kg/m³) is placed in the larger tube so that it floats, as shown in the right diagram. The object is $D = 37.5$ mm in diameter and $H = 76.2$ mm high. Neglect any capillary rise due to surface tension effects.

- Calculate the pressure at the lower surface needed to float the object (20 points)
- Determine the new equilibrium level, h , of the mercury with the brass cylinder in place (5 points)

Problem 4: (25 points)

You need to gently place a steel razor blade on a free surface of water so it “floats” on the water as shown in the figure. The razor blades come in two types with properties described below:

Razor Type	Mass (g)	Size (Total length of sides (mm))
Double Edge	0.640	206
Single Edge	2.61	154

- Derive an expression relating the surface tension to the razor blade size and mass. (15 points)
- Given water surface tension is 73.4×10^{-3} N/m, determine which blade, if any, will float, and the corresponding contact angle. (10 points)

Centroidal Moments of Inertia for Various Cross Sections:

Copyright © The McGraw-Hill Companies, Inc. Permission required for reproduction or display.

$$A = bL$$

$$I_{xx} = \frac{bL^3}{12}$$

$$I_{xy} = 0$$

(a)

$$A = \pi R^2$$

$$I_{xx} = \frac{\pi R^4}{4}$$

$$I_{xy} = 0$$

(b)

$$A = \frac{bL}{2}$$

$$I_{xx} = \frac{bL^3}{36}$$

$$I_{xy} = \frac{b(b-2s)L^2}{72}$$

(c)

$$A = \frac{\pi R^2}{2}$$

$$I_{xx} = 0.10976R^4$$

$$I_{xy} = 0$$

(d)

Useful Equations:

Location of x_{cp} and y_{cp} of the hydrostatic force on submerged plane:

$$x_{cp} = -\rho g \cdot \frac{I_{xy} \cdot \sin\theta}{F_R}$$

$$y_{cp} = -\rho g \cdot \frac{I_{xx} \cdot \sin\theta}{F_R}$$

Where F_R is the magnitude of the hydrostatic force.

Where needed, use water density of 1000 kg/m^3 .
