- I. A solution known to contain both ferrocyanide  $[\text{Fe}(\text{CN})_6^{4-}]$  and ferricyanide  $[\text{Fe}(\text{CN})_6^{3-}]$  ions was examined spectrophotometrically at a wavelength of 420 nm, where only ferricyanide absorbs. A portion of the solution was placed into a 1-cm cell and found to have a transmittance of 0.118. The molar absorptivity of ferricyanide at 420 nm is 505 liter mole<sup>-1</sup> cm<sup>-1</sup>. A platinum indicator electrode was inserted into the solution of ferricyanide and ferrocyanide, and its potential was observed to be +0.337 V versus the normal hydrogen electrode. Calculate the concentrations of ferricyanide and ferrocyanide in the original solution.

$$[\text{Fe}(\text{CN})_6^{4-}] = \dots\dots\dots \text{ M}$$

$$[\text{Fe}(\text{CN})_6^{3-}] = \dots\dots\dots \text{ M}$$

II. Calculate the absolute and the relative standard deviations ( $S_y$  and  $\frac{S_y}{y}$  respectively), and round the result to the appropriate number of significant figures. the numbers in parentheses are absolute standard deviations.

a) 
$$y = \frac{7.9(\pm 0.3) \times \log_{10}[15.7(\pm 0.5) - 3.12(\pm 0.06)]}{0.721(\pm 0.004) + [2.15(\pm 0.02)]^2} = 1.626107\dots\dots$$

$S_y = \dots\dots\dots$   
 $\frac{S_y}{y} = \dots\dots\dots$   
 $y = \dots\dots\dots \pm \dots\dots\dots$

b) 
$$y = \left\{ 2.25(\pm 0.05) - \log_{10}[4.6(\pm 0.2)]^2 \right\}^3 = 0.790130219\dots\dots$$

$S_y = \dots\dots\dots$   
 $\frac{S_y}{y} = \dots\dots\dots$   
 $y = \dots\dots\dots \pm \dots\dots\dots$

III. Copper in salt water near the discharge of a sewage treatment plant is determined by first separating and concentrating it by solvent extraction of its dithizone at pH 3 into methylene chloride and then evaporating the solvent, ashing (ash is the powder remained after burning) the chelate to destroy the organic portion, and titrating the copper with EDTA. Three 1-L portions of the sample are each extracted with 25-mL portions of methylene chloride and the extracts are combined in a 100-mL volumetric flask and diluted to volume. A 50-mL aliquot is evaporated, ashed, and titrated. If EDTA solution has a  $\text{CaCO}_3$  titer of 2.69 mg/mL and 2.67 mL is required for titration of the copper, what is the concentration of copper in the sea water in parts per million?

Concentration = ..... ppm

- IV. A sample that might be a sodium carbonate-bicarbonate or sodium carbonate-hydroxide mixture was titrated using the two indicator method. A 1.000-g sample required 31.64 mL of 0.2000-M HCl to reach the phenolphthalein end point and an additional 14.36 mL to reach the methyl orange end point. Identify the mixture and calculate the percentage of each component. (Fill the results in the table).

V. Given that the galvanic cell

contains equal volumes of solutions in the two half-cells, calculate:

a) the emf of the cell.

emf = ..... V

- b) the potentials of the half-cells and the concentrations of the various ions at the equilibrium state.

Potential of the left-hand half-cell = ..... V

Potential of the right-hand half-cell = ..... V

$[\text{MnO}_4^-]$  = ..... M

$[\text{Fe}^{2+}]$  = ..... M

$[\text{H}^+]$  = ..... M

$[\text{Mn}^{2+}]$  = ..... M

$[\text{Fe}^{3+}]$  = ..... M

- VI. X mg of  $\text{Na}_2\text{SO}_4 \cdot n\text{H}_2\text{O}$  is dissolved in water and the solution is diluted to 1000 mL (solution A). 2X mg of anhydrous  $\text{Na}_2\text{SO}_4$  is dissolved and diluted to 1000 mL of solution B. The potential of a sodium-selective electrode against a suitable reference electrode is +0.1286 V in solution A and - 0.1675 V in solution B. Calculate the number of water molecules n. in the salt  $\text{Na}_2\text{SO}_4 \cdot n\text{H}_2\text{O}$  (assume activity equals concentration).

n = .....
