

97

NDU
Computer Architecture
CSC 312 Midterm.
Duration 1 hour 30 minutes.

April 7, 2008

Name: _____

1. The content of PC in the basic computer is 2F9 (all numbers are in hexadecimal). The content of AC is AAAA. The content of memory at address 2F9 is D520. The content of memory at address 520 is 3456. The content of memory at address 345 is FFFF. The content of memory at address 456 is EEEE. Give the contents of the registers PC , AR , DR , AC , IR , SC , E , & I in hexadecimal at the end of the instruction cycle. (20 pts)

$$PC = 2F9$$

$$AC = AAAA$$

$$M[2F9] = D520$$

$$M[520] = 3456$$

$$M[345] = FFFF$$

$$M[456] = EEEE$$

T_0

$$AR_c \leftarrow PC$$

$$AC = PC = 2F9$$

T_1

$$IR \leftarrow M[PC]$$

REG

$$PC \leftarrow PC + 1$$

$$PC = 2FA$$

$$IR = M[2FA] = D520$$

T_2

$$I[15:0] = 00000000$$

$$I[11:0] = 00000000$$

$$AR \leftarrow IR(4:0)$$

$$AC \leftarrow IR(4:0)$$

$$I[15:0] = 00000000$$

$$I[11:0] = 00000000$$

$$AR = 520$$

$$I[15:0] = 00000000$$

$$I[11:0] = 00000000$$

$$I[15:0] = 00000000$$

$$I[11:0] = 00000000$$

T_3

Since my $I[1:1] = 0$

$$AR \leftarrow M[PC]$$

$$AR = 3456$$

$$AR = 456$$

Since AR is 12 bit

T_4

$$M[AR] \leftarrow PC$$

$$AR \leftarrow AR + 1$$

$$M[2FA] = 2FA$$

$$AR = 457$$

$$PC = 457$$

$$AR = 521$$

$$DR = \text{No charge}$$

$$AC = \text{No charge}$$

$$IR = D520$$

$$SC = 5$$

$$E = 0$$

$$T = 1$$

2. In an 8-bit registers R1 & R2, starting from an initial value of $R1 = 00110110$, $R2 = 01000111$, what will be the value of R1 after each operation. (Use the new value of R1 for each new operation). (10 pts)

Operation	Value of R1
i) $R1 \leftarrow Shl\ R1$	01101100
ii) $R1 \leftarrow R1 \vee R2$	01101111
iii) $R1 \leftarrow Ashr\ R1$	00110111
iv) $R1 \leftarrow R1 + R2$	01111110
v) $R1 \leftarrow Cil\ R2$	10001110

10

a) $R1: 00110110$
 $shl R1: 01101100 \rightarrow \text{new } R1$

b) $R1: R_1: 01101100$
 $R2: R_2: 01000111$
 \hline
 $01101111 \rightarrow \text{new } R1$

c) $R1: 01101111$
 $Ashr R1: 0.01101111 \rightarrow \text{new } R1$

d) $+ R_1$
 $+ R_2$
 \hline
 $01111110 \rightarrow \text{new } R1$

e) $R_2: 01000111$
 $Cil R_2: 10001110 \rightarrow \text{new } R1$

3. Write the minimum sequence of micro-operations for the following instruction:

a. $AC \leftarrow TR - IR - DR - 2$

$AC \leftarrow TR - (IR + DR + 2)$

(10 pts)

~~AC = 0~~

$DR \leftarrow IR$

$AC \leftarrow IR$

~~DR~~

$DR \leftarrow DR + 1$

$DR \leftarrow DR + 1$

$AC \leftarrow DR, DR \leftarrow IR$

$AC \leftarrow AC + DR, DR \leftarrow TR$

$AC \leftarrow AC$

$AC \leftarrow AC + 1$

$AC \leftarrow DR + AC$

// part 2

$AC = DR + 2$
 $DR = IR$

10.

THE DEBATE CLUB

3. Write the minimum sequence of micro-operations for the following instruction:

a. $AC \leftarrow TR - IR - DR - 2$

$$AC \leftarrow TR - (IR + DR + 2)$$

(10 pts)

~~AC ←~~

~~DR ← IR~~

~~IR ← AC ← DR~~

~~DR ← DR + 1~~

~~DR ← DR + 1~~

~~AC ← DR, DR ← IR~~

// step 2

~~AC = DR + 2~~
~~DR = IR~~

~~AC ← AC + DR, DR ← TR~~

~~AC ← AC~~

~~AC ← AC + 1~~

~~AC ← DR + AC~~

10
THE DEBATE CLUB

4. Using the common bus, check if each of the following instructions can be executed in one clock cycle; if yes, what will be the control signals to execute it, if not, say why? (10 pts)
- $M[AR] \leftarrow DR, AC \leftarrow DR, IR \leftarrow 0$
 - $PC \leftarrow M[AR], AC \leftarrow AC + DR, PC \leftarrow 0$
 - $IR \leftarrow IR + 1, OUTR \leftarrow M[AR]$

a) Yes

$S_2 S_1 S_0 = 011$
~~RS~~

~~write~~
 $WR = 1$
~~RD~~

$ALU(TRANSf) = 1$

$LD(AC) = 1$
 $CLEAR(IR) = 1$

b) Yes

$S_2 S_1 S_0 = 111$
 $RS = 1$
 $RD = 1$
 $LO(PC) = 1$
 $ALU(MOD) = 1$

NO since some destination
 $\{PC = 0\}$
 $\{PC = MCAR\}$

No since IR can just load we can not increment

5. The memory unit of the basic computer is to be changed to a 65536×16 memory, requiring an address of 16 bits. The instruction format of a memory-reference instruction remains the same for $I = 1$ (indirect address) with the address part of the instruction residing in positions 0 through 11. But when $I = 0$ (direct address), the address of the instruction is given by the 16 bits in the next word following the instruction. Modify the micro-operations during time T_2 , T_3 , and T_4 if necessary to conform to this configuration. (10 pts)

$T_0: AR \leftarrow PC$

$T_1: IR \leftarrow MCAR, PC \leftarrow PC + 1$

$T_2: AR \leftarrow IR(0,11), DRA = IR(12,14), I = 32(1)$

$T_3: I \begin{cases} 0 & \rightarrow AR \leftarrow PC \\ 1 & \rightarrow AR \leftarrow IR(0,11) \end{cases}$

$T_4: AR \leftarrow MCAR$ when $I = 1$

6. Write an assembly program to count the positive values, the negative values, and the zero values in a block of memory starting at address 190, ending at address 200. (20 pts)

7. Write an assembly program to divide a memory block, starting at address 150 and ending at address 200, into two memory blocks BlockA & BlockB (not necessary of the same size), where BlockA holds the odd operands, and BlockB holds the even operands. Find the ending address for each block if BlockA starts at address 201 and BlockB at address 301. (20 pts)
