Lecture 4 Conditional Probability Examples

Naima Hammoud

June 12, 2019

- C1 = car behind door 1
- C2 = car behind door 2
- C3 = car behind door 3

- D1 = host opens door 1
- D2 = host opens door 2
- D3 = host opens door 3

- C1 = car behind door 1
- C2 = car behind door 2
- C3 = car behind door 3

- D1 = host opens door 1
- D2 = host opens door 2
- D3 = host opens door 3

- C1 = car behind door 1
- C2 = car behind door 2
- C3 = car behind door 3

- D1 = host opens door 1
- D2 = host opens door 2
- D3 = host opens door 3

P(C1) = P(C2) = P(C3) = 1/3

- C1 = car behind door 1
- C2 = car behind door 2
- C3 = car behind door 3

D1 = host opens door 1

D2 = host opens door 2

$$D3 = host opens door 3$$

$$P(C1) = P(C2) = P(C3) = 1/3$$

I choose door 1, so now I know the host has to open either door 2 or door 3 with equal probability, but the host knows where the car is, so:

- C1 = car behind door 1
- C2 = car behind door 2
- C3 = car behind door 3

D1 = host opens door 1

D2 = host opens door 2

$$D3 = host opens door 3$$

$$P(C1) = P(C2) = P(C3) = 1/3$$

I choose door 1, so now I know the host has to open either door 2 or door 3 with equal probability, but the host knows where the car is, so:

P(D2 | C1) = 0.5, P(D2 | C2) = 0, P(D2 | C3) = 1

- C1 = car behind door 1
- C2 = car behind door 2
- C3 = car behind door 3

D1 = host opens door 1

D2 = host opens door 2

$$D3 = host opens door 3$$

$$P(C1) = P(C2) = P(C3) = 1/3$$

I choose door 1, so now I know the host has to open either door 2 or door 3 with equal probability, but the host knows where the car is, so:

P(D2 | C1) = 0.5, P(D2 | C2) = 0, P(D2 | C3) = 1P(D3 | C1) = 0.5, P(D3 | C2) = 1, P(D3 | C3) = 0

- P(C1) = P(C2) = P(C3) = 1/3
- I choose door 1
- P(D2 | C1) = 0.5, P(D2 | C2) = 0, P(D2 | C3) = 1
- P(D3 | C1) = 0.5, P(D3 | C2) = 1, P(D3 | C3) = 0
- Host opens D3 and it has a goat

- P(C1) = P(C2) = P(C3) = 1/3
- I choose door 1
- P(D2 | C1) = 0.5, P(D2 | C2) = 0, P(D2 | C3) = 1
- P(D3 | C1) = 0.5, P(D3 | C2) = 1, P(D3 | C3) = 0
- Host opens D3 and it has a goat
- Compare P(C1 | D3) and P(C2 | D3)

- P(C1) = P(C2) = P(C3) = 1/3
- I choose door 1
- P(D2 | C1) = 0.5, P(D2 | C2) = 0, P(D2 | C3) = 1
- P(D3 | C1) = 0.5, P(D3 | C2) = 1, P(D3 | C3) = 0
- Host opens D3 and it has a goat
- Compare P(C1 | D3) and P(C2 | D3)

$$P(C1|D3) = \frac{P(D3|C1)P(C1)}{P(D3)} \longrightarrow P(C2|D3) = \frac{P(D3|C2)P(C2)}{P(D3)}$$

- P(C1) = P(C2) = P(C3) = 1/3
- I choose door 1
- P(D2 | C1) = 0.5, P(D2 | C2) = 0, P(D2 | C3) = 1
- P(D3 | C1) = 0.5, P(D3 | C2) = 1, P(D3 | C3) = 0
- Host opens D3 and it has a goat
- Compare P(C1 | D3) and P(C2 | D3)

$$P(C1|D3) = \frac{P(D3|C1)P(C1)}{P(D3)} \longrightarrow P(C2|D3) = \frac{P(D3|C2)P(C2)}{P(D3)}$$

$$\frac{1/3}{2/3}$$

SWITCH TO DOOR 2

$$P(C1|D3) = \frac{P(D3|C1)P(C1)}{P(D3)} \longrightarrow P(C2|D3) = \frac{P(D3|C2)P(C2)}{P(D3)}$$

$$\frac{1/3}{2/3}$$

Plane Detectors

Suppose that the probability you see a plane when you look up to the sky is 5%, and let's say that we have a radar which registers a plane with 99% accuracy. There is also a 10% chance for the radar to sound a false alarm.

Suppose that the probability you see a plane when you look up to the sky is 5%, and let's say that we have a radar which registers a plane with 99% accuracy. There is also a 10% chance for the radar to sound a false alarm.

- The event that we see a plane
- The event that we do not see a plane
- The event that the radar registers something
- The event that the radar registers nothing

Suppose that the probability you see a plane when you look up to the sky is 5%, and let's say that we have a radar which registers a plane with 99% accuracy. There is also a 10% chance for the radar to sound a false alarm.

- The event that we see a plane
- The event that we do not see a plane
- The event that the radar registers something
- The event that the radar registers nothing

Suppose that the probability you see a plane when you look up to the sky is 5%, and let's say that we have a radar which registers a plane with 99% accuracy. There is also a 10% chance for the radar to sound a false alarm.

B^c = event that radar didn't register anything

A = event that we see a plane
A^c = event that we don't see a plane
B = event that the radar registers something
B^c = event that radar didn't register anything

A = event that we see a plane
A^c = event that we don't see a plane
B = event that the radar registers something
B^c = event that radar didn't register anything

What is the probability that the radar registers something?

What is the probability that the radar registers something?

 $P(B) = P(A \text{ and } B) + P(A^c \text{ and } B)$

 $0.05 \times 0.99 = 0.0495$ $0.05 \times 0.99 = 0.0495$ There is a plane and radar registered it $0.05 \quad 0.01 \quad B^{c} \rightarrow \text{There is a plane, but radar did not register it}$ $0.95 \times 0.1 = 0.095 \quad 0.9 \quad B^{c} \rightarrow \text{There is no plane and radar did not register}$

What is the probability that the radar registers something?

 $P(B) = P(A \text{ and } B) + P(A^c \text{ and } B)$ = 0.0495 + 0.095 = 0.1445

 $0.05 \times 0.99 = 0.0495$ $0.05 \times 0.99 = 0.0495$ There is a plane and radar registered it $0.05 \quad 0.01 \quad B^{c} \rightarrow \text{There is a plane, but radar did not register it}$ $0.95 \quad 0.1 \quad B \rightarrow \text{False alarm}$ $0.95 \times 0.1 = 0.095 \quad 0.9 \quad B^{c} \rightarrow \text{There is no plane and radar did not register}$

What is the probability that the radar registers something?

 $P(B) = P(A \text{ and } B) + P(A^c \text{ and } B)$ = 0.0495 + 0.095 = 0.1445

There is a 14.45% chance that the radar registers something!

 $\begin{array}{cccc} 0.05 & A & \overbrace{0.01}^{0.09} & B & \longrightarrow & \text{There is a plane and radar registered it} \\ 0.05 & A & \overbrace{0.01}^{0.01} & B^c & \longrightarrow & \text{There is a plane, but radar did not register it} \\ 0.95 & A^c & \overbrace{0.9}^{0.1} & B & \longrightarrow & \text{False alarm} \\ A^c & \overbrace{0.9}^{0.9} & B^c & \longrightarrow & \text{There is no plane and radar did not register} \end{array}$

 $\begin{array}{cccc} 0.05 & A & \overbrace{0.01}^{0.09} & B & \longrightarrow & \text{There is a plane and radar registered it} \\ 0.05 & A & \overbrace{0.01}^{0.01} & B^c & \longrightarrow & \text{There is a plane, but radar did not register it} \\ 0.95 & A^c & \overbrace{0.9}^{0.1} & B & \longrightarrow & \text{False alarm} \\ A^c & \overbrace{0.9}^{0.9} & B^c & \longrightarrow & \text{There is no plane and radar did not register} \end{array}$

What is the probability that **there is a plane** given that **the radar registered something**?

P(A|B)

 $\begin{array}{cccc} 0.05 & A & \overbrace{0.01}^{0.09} & B & \longrightarrow & \text{There is a plane and radar registered it} \\ \hline 0.05 & A & \overbrace{0.01}^{0.01} & B^c & \longrightarrow & \text{There is a plane, but radar did not register it} \\ \hline 0.95 & A^c & \overbrace{0.9}^{0.1} & B & \longrightarrow & \text{False alarm} \\ \hline A^c & \overbrace{0.9}^{0.9} & B^c & \longrightarrow & \text{There is no plane and radar did not register} \end{array}$

$$P(A|B) = \frac{P(A \text{ and } B)}{P(B)}$$

 $\begin{array}{cccc} 0.05 & A & \overbrace{0.01}^{0.09} & B & \longrightarrow & \text{There is a plane and radar registered it} \\ \hline 0.05 & A & \overbrace{0.01}^{0.01} & B^c & \longrightarrow & \text{There is a plane, but radar did not register it} \\ \hline 0.95 & A^c & \overbrace{0.9}^{0.1} & B & \longrightarrow & \text{False alarm} \\ \hline A^c & \overbrace{0.9}^{0.9} & B^c & \longrightarrow & \text{There is no plane and radar did not register} \end{array}$

$$P(A|B) = \frac{P(A \text{ and } B)}{P(B)}$$

 $0.05 \times 0.99 = 0.0495$ $0.99 \quad B \quad \rightarrow \text{ There is a plane and radar registered it}$ $0.05 \quad 0.01 \quad B^{c} \quad \rightarrow \text{ There is a plane, but radar did not register it}$ $0.95 \quad 0.1 \quad B \quad \rightarrow \text{ False alarm}$ $A^{c} \quad 0.1 \quad B^{c} \quad \rightarrow \text{ There is no plane and radar did not register}$

$$P(A|B) = \frac{P(A \text{ and } B)}{P(B)}$$

 $0.05 \times 0.99 = 0.0495$ $0.99 \quad B \quad \rightarrow \text{ There is a plane and radar registered it}$ $0.05 \quad 0.01 \quad B^{c} \quad \rightarrow \text{ There is a plane, but radar did not register it}$ $0.95 \quad 0.1 \quad B \quad \rightarrow \text{ False alarm}$ $A^{c} \quad 0.1 \quad B^{c} \quad \rightarrow \text{ There is no plane and radar did not register}$

$$P(A|B) = \underbrace{\begin{array}{c}P(A \text{ and } B)\\P(B)\\0.145\end{array}}$$

 $0.05 \times 0.99 = 0.0495$ $0.99 \quad B \quad \rightarrow \text{ There is a plane and radar registered it}$ $0.05 \quad 0.01 \quad B^{c} \quad \rightarrow \text{ There is a plane, but radar did not register it}$ $0.95 \quad 0.1 \quad B \quad \rightarrow \text{ False alarm}$ $A^{c} \quad 0.1 \quad B^{c} \quad \rightarrow \text{ There is no plane and radar did not register}$

$$P(A|B) = \frac{P(A \text{ and } B)}{P(B)} = \frac{0.0495}{0.1445} \approx 0.34$$

0.145

 $\begin{array}{cccc} 0.05 & A & \overbrace{0.01}^{0.09} & B & \longrightarrow & \text{There is a plane and radar registered it} \\ 0.05 & A & \overbrace{0.01}^{0.01} & B^c & \longrightarrow & \text{There is a plane, but radar did not register it} \\ 0.95 & A^c & \overbrace{0.9}^{0.1} & B & \longrightarrow & \text{False alarm} \\ A^c & \overbrace{0.9}^{0.9} & B^c & \longrightarrow & \text{There is no plane and radar did not register} \end{array}$

What is the probability that **there is a plane** given that **the radar registered something**?

$$P(A|B) = \frac{P(A \text{ and } B)}{P(B)} = \frac{0.0495}{0.1445} \approx 0.34$$

If the radar registers something, there's only a 34% chance that there's actually a plane!

HIV Testing

As of 2009, Swaziland had the highest HIV prevalence in the world. 25.9% of this country's population is infected with HIV. The ELISA test is one of the first and most accurate tests for HIV. For those who carry HIV, the ELISA test is 99.7% accurate. For those who do not carry HIV, the test is 92.6% accurate. If an individual from Swaziland has tested positive, what is the probability that they carry HIV?

As of 2009, Swaziland had the highest HIV prevalence in the world. 25.9% of this country's population is infected with HIV. The ELISA test is one of the first and most accurate tests for HIV. all possible events

 $\begin{array}{ccc} 0.259 & \text{HIV} & \overbrace{0.003}^{0.997} & + & \rightarrow \end{array} \text{The person has HIV and they tested positive} \\ \hline 0.259 & 0.003 & - & \rightarrow \end{array} \text{The person has HIV but they tested negative (false negative)} \\ \hline 0.741 & 0.074 & + & \rightarrow \end{array} \text{False positive}$

As of 2009, Swaziland had the highest HIV prevalence in the world. 25.9% of this country's population is infected with HIV. The ELISA test is one of the first and most accurate tests for HIV. For those who carry HIV, the ELISA test is 99.7% accurate. For those who do not carry HIV, the test is 92.6% accurate. If an individual from Swaziland has tested positive, what is the probability that they carry HIV?

- HIV: the event that a person has HIV
- no HIV: the event that a person does not have HIV
- +: the event that a person tests positive for HIV

If the patient from Swaziland takes the ELISA test and it yields a positive result, what is the probability that they have HIV?

If the patient from Swaziland takes the ELISA test and it yields a positive result, what is the probability that they have HIV?

want to find P(HIV|+)

If the patient from Swaziland takes the ELISA test and it yields a positive result, what is the probability that they have HIV?

want to find
$$P(HIV|+) = \frac{P(HIV \text{ and } +)}{P(+)}$$

 $+ \longrightarrow$ The person has HIV and they tested positive 0.997 HIV 0.259The person has HIV but they tested negative (false negative) 0.003 $0.074 + \longrightarrow$ False positive 0.741no HIV< The person has no HIV and they tested negative 0.926 $P(HIV|+) = \frac{P(HIV \text{ and } +)}{P(+)}$

$$P(HIV|+) = \frac{P(HIV \text{ and } +)}{P(+)} = \frac{0.259 \times 0.997}{P(+)}$$
$$= \frac{0.259 \times 0.997}{0.258 + \dots}$$

Conclusion:

Therefore, if a person from Swaziland tests positive for HIV, there is an 82.5% chance that they have HIV (or a 17.5% chance that they do not have HIV). So, their chances of having the disease are pretty high.

Conclusion:

Therefore, if a person from Swaziland tests positive for HIV, there is an 82.5% chance that they have HIV (or a 17.5% chance that they do not have HIV). So, their chances of having the disease are pretty high.

If I go and take the HIV test now and it turns out positive, should I freak out?

Conclusion:

Therefore, if a person from Swaziland tests positive for HIV, there is an 82.5% chance that they have HIV (or a 17.5% chance that they do not have HIV). So, their chances of having the disease are pretty high.

If I go and take the HIV test now and it turns out positive, should I freak out?

Not really, there's only 0.54% chance that I actually have HIV if the test turns out positive!

Breast Cancer Testing (Mammograms)

American Cancer Society estimates that about 2% of women have breast cancer. Susan G. Komen for The Cure Foundation states that "Overall, the sensitivity of mammography is about 84 percent. This means mammography correctly identifies about 84 percent of women who truly have breast cancer." A recent study published in 2015 by the journal Cancer Epidemiology, Biomarkers & Prevention suggests that about 8% of all mammograms are false positives.

$$=\frac{0.02\times0.84}{0.0168+0.0784}\approx0.176$$

Conclusion:

If a woman tests positive for a mammogram, the probability that she has cancer is about 0.176, or 17.6%.

Conclusion:

If a woman tests positive for a mammogram, the probability that she has cancer is about 0.176, or 17.6%.

If she repeats the test and it turns out positive again, do you think her chances of actually having cancer are higher than 17.6%?

Conclusion:

If a woman tests positive for a mammogram, the probability that she has cancer is about 0.176, or 17.6%.

If she repeats the test and it turns out positive again, do you think her chances of actually having cancer are higher than 17.6%?

Your prior assumption now has to change: before taking the test, this woman's chances of having breast cancer were 2%; after she has tested positive, her chances increased to 17.6%

Conclusion:

If a woman tests positive for a mammogram, the probability that she has cancer is about 0.176, or 17.6%.

If she repeats the test and it turns out positive again, do you think her chances of actually having cancer are higher than 17.6%?

Conclusion:

If a woman tests positive for a mammogram, the probability that she has cancer is about 0.176, or 17.6%.

If she repeats the test and it turns out positive again, do you think her chances of actually having cancer are higher than 17.6%?

Based on the new tree:

$$P(BC|+) = \frac{P(BC \text{ and } +)}{P(+)} = \frac{0.176 \times 0.84}{(0.176 \times 0.84) + (0.824 \times 0.08)}$$

Conclusion:

If a woman tests positive for a mammogram, the probability that she has cancer is about 0.176, or 17.6%.

If she repeats the test and it turns out positive again, do you think her chances of actually having cancer are higher than 17.6%?

Based on the new tree:

$$P(BC|+) = \frac{P(BC \text{ and } +)}{P(+)} = \frac{0.176 \times 0.84}{(0.176 \times 0.84) + (0.824 \times 0.08)} \approx 0.69$$

Conclusion:

If a woman tests positive for a mammogram, the probability that she has cancer is about 0.176, or 17.6%.

If she repeats the test and it turns out positive again, do you think her chances of actually having cancer are higher than 17.6%?

Therefore, if this woman's test turns out positive again, her chances of having breast cancer have gone up to 69% 😕
